LATEST RECORDS OF The TRUSTY TRIUMPH

The first occasion a four-valve engine has ever been credited with the Blue Riband of track achievements—the 500 c.c. One Hour World's Record—was that upon which Major F. B. Halford, on the famous 3½ h.p. O.H.V. TRIUMPH, covered the remarkable distance of 76 miles, 1,301 yards = 76.74 m.p.h.

Major Halford has also broken the following British and World's Records, Class C, 500 c.c. :—

BRITISH RECORD.
1 Mile (Flying), 41.0 secs., speed 87.80 m.p.h.

WORLD'S RECORDS.
1 Mile (Fly'g), 42.90 s., sp. 83.91 m.p.h. (meantime)
50 Miles (Std 'g), 38m. 49.4s., speed 77.27 m.p.h.
One Hour .. 76m. 1,301 yds. sp. 76.74 m.p.h.
*Subject to A.C.U. and F.I.C.M. Confirmation*

# In the ROUGH

*A Beardmore-Precision rider in the Kilmacolm Uplands, Renfrewshire*

When the going is rough, the gradient single-figure, the wind head on, the rain lashing your face—that's when you learn the sterling value of a good spring frame.

No need to glue your eyes to the road on the watch for potholes or boulders. They are damped out for you. When you're fighting adversity in the saddle *a good spring frame is half the battle.*

The Beardmore-Precision design combines Comfort with Safety because it cannot distort and upset the steering; with Strength—the strength of a battleship—because of the patent pressed-steel construction. No need for a saving clause in *our* guarantee to say you "musn't misuse the frame." You *can't!*

Beard

more

**Export Houses and Agents Overseas** should get in touch with us at once. The 1922 4½ h.p. spring-frame Beardmore-Precision ("big-single" four-stroke with automatic lubrication, detachable cylinder head, three-speed gear in unit with engine and all-chain drive) is ideal for colonial conditions. "The Motor Cycle" remarks (10th Nov.) that the pre-war "Precision" of this power was *sold overseas in greater quantities than at home.* Our Service-after-Sale, too, is as efficient now as it was then.

**F. E. BAKER, LTD.,**
(Associated with William Beardmore & Co., Ltd.)

## The New Year.

AT the beginning of a new year it is interesting to pause a moment and reflect upon the outstanding impressions of the old year.

The last six months of the year 1921 were not distinguished by big sales in the motor cycle industry, but a number of circumstances combined to make trade bad. Lack of orders from overseas checked demand, though, fortunately, these adverse conditions are regarded as of a temporary nature. Indifferent export facilities, the unsettled state of Irish affairs, and high prices all limited the market. Towards the end of the year, however, prices dropped to a considerable degree, and a steady business was done at the Olympia Motor Cycle Show.

More encouraging than the actual number of sales was the enormous interest displayed by the public, which is confirmed by the large number of orders and promising enquiries received by manufacturers since the Show. This feature has been particularly marked, and some few manufacturers who came away from Olympia barely satisfied are now busily producing to meet the demand for their good, which arose and extended very promisingly with the close of the year.

The outlook for the New Year is distinctly brighter. With reviving trade, the stabilisation of prices, the steady progress in design, and the more hopeful political outlook, there is excellent promise of a busy spring. Prospects for the trade are hopeful, and prospects for the riders are equally bright, since never before have such admirable machines of every type been offered at such comparatively low prices, and, withal, running expenses are appreciably reduced, thanks to considerable reductions in the cost of the main necessities, *i.e.*, petrol, oil, and tyres. Therefore, we feel that, in offering our readers our heartiest good wishes for the New Year the future outlook may truthfully be said to be far and away more encouraging than was the case twelve months ago.

## Electrical Fittings.

NOW that electrical equipment is being so universally applied to motor cycles, a word to those responsible for the production of the smaller detail fittings will not be out of season.

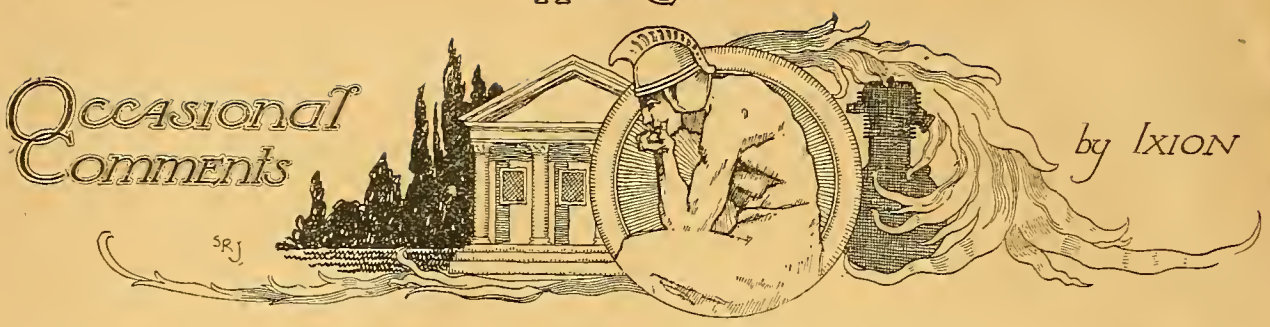
In a somewhat rough and ready way a fairly satisfactory standardisation of sizes was attained in the electrical trade before it became of great interest to motor cyclists, but withal, due to the enormous use of presswork in lamp fittings, switches and other parts, the standard of interchangeability *is* of the rough and ready order.

Ostensibly, all bulbs and bulb-holders of the s.b.c. (small bayonet cap) variety are of the same size, but it frequently happens that a replacement bulb cannot be inserted into a holder without enlargement of the latter, while in the case of the single contact type of bulb, the small blob of solder over the end of the "earth" wire on the bulb cap prevents the complete insertion of the latter in the holder.

Another direction in which head lamp bulbs might be improved is in the positioning of the filament in relation to some definite point, such as the pins of the bayonet cap; this would avoid the frequent difficulty experienced when a new bulb is found to need more adjustment to secure correct focus than the mechanism of the head lamps permits. In many cases head lamp focussing adjustments might with advantage be given a wider range.

Tumbler switches, and suchlike fittings, although satisfactory in the ordinary indoor applications of electrical apparatus, are neither weather nor vibration proof, and the electrical trade has much to learn in this direction. The highly-elaborated products of motor cycle lighting specialists, of course, seldom merit criticism, and these remarks are chiefly made in the interest of those motor cyclists who equip their machines with the ordinary electrical fittings of commerce such as are obtainable from cycle and electrical accessory dealers.

An Index to the advertisements in this issue will be found on the page facing the back cover.



## Nemesis.

EVERY sport has its liars. Anglers still enjoy priority in popular estimation, but when some Gilbert White has arisen to write a motor cycle Selborne, we motor cyclists will push the angler down one place. Our commonest and least convincing liars are those who tell all and sundry that they never have "a mite of trouble." Now I happen to be Greek to the core, though the world only knows me as a twentieth century penny-a-liner. [You *know* you get a lot more than that!—Ed. I know it *sounds* more, but think of my running expenses!—Ixion.] As I was saying when this rude person interrupted me, I am a Greek, and therefore I believe in Nemesis. Nemesis was a goddess of the malevolent kind, who adjusted the balances of fate for profiteers, and Cuthberts, and people of that sort. So after a 1921 season in which I hardly experienced even one trivial stop, I prepared myself for a troublous winter, knowing that the gods are just. It has begun. Item No. 1. I was hogging to catch a distant train on a cold, dark, wet night, my mount being a cycle car. Suddenly, just when the one and only hill of the trip loomed ahead, the sharp, crisp bark of the engine suddenly diminuendoed to a noise which I can only describe as the sort of sound which cottonwool would make if it were audible. Anon it seized. When I at last regained civilisation, in true Greek fashion I poured a small libation to Nemesis. Beer, of course; wine is too costly nowadays.

## False to my Convictions.

BUT the lady wasn't appeased. I shall never again try to economise in religious matters. A goddess who has been accustomed to libations of thick wine for 3,000 years evidently takes no account of the watery stuff which passes for ale nowadays. So she got me again next time out. Once again I was driving a cycle car. Let me premise that I have frequently denounced the silly practice of "blacking out," *i.e.*, extinguishing one's head lamps on meeting another vehicle. Moreover, I have rashly sworn that I would never adopt it. This was how Nemesis squared the account between us. I had just reached a road full of traffic but devoid of garages when all my five electric lamps proceeded to go out. I trod on everything hard. The lamps shone out again. In this fashion we progressed. I had no inspection lamp. I did not even know where the batteries were kept on the cycle car, which was on a press trial, and not my own. When the lamps developed a knack of going out for as much as fifty yards at a time, I stopped, and struck matches. There were literally miles of very thin, semi-insulated cable, precariously affixed to the one-piece three-ply body by little hanks of leather and brass screws, after the fashion of a gardener tying up fruit trees. Suffice it to say that I eventually reached my destination, after many hairbreadth escapes. Perhaps Nemesis will now be satisfied. At any rate, I spilt a few drops of port on the garage floor when I got home.

## Anachronisms.

THAT is the only long word I know. It was a pet word of my colonel's in the great war, and I took it up to curry favour with him. Unfortunately, I didn't quite understand it, and when I applied it to a bad egg, he expounded its true meaning to me at length. It means a tollgate. The other week I remarked that tollgates were moribescent, so to speak—dear me, that colonel has a lot to answer for—and ever since I have had a perfect avalanche of letters from irate motor cyclists, whose jaunts awheel are hampered by these survivals of the Middle Ages. The most pathetic is from a gentleman resident in Barmouth and *fiancé* to a damosel at Portmadoc. These conditions imply a quite expensive spruceness in personal appearance. Buttonholes. New chamois gloves. Then there are chocolates. Finally, two shilling tollgates in as many miles. And the Government appeals to us to be economical, and lend it our money! Another wistful epistle is signed by a Bachelor of Divinity belonging to one of the Nonconformist denominations. I understand that a padre of this connection usually serves about half a gross of chapels dotted over a huge area. My correspondent labours in a part of the country which simply bristles with tollgates. Here is a chance for the Ministry of Transport to wield the super-axe with great popularity.

## Decanted from a Sidecar.

APROPOS of my yarns of humorous incidents connected with trailers, a Southend reader claims to have seen a lady neatly decanted from a sidecar without the driver's knowledge. 'Twas years ago, and the sidecar was of the wicker variety, with nothing in front of its occupant except a low basket-work sill. The outfit was rounding a sharpish corner and the lady was leaning forward at the time. The sidecar bobbed over a pot-hole, and the lady was gently lobbed out, what time the driver was staring hard round the corner to make sure nothing was coming. Informant infers that the pair were married, as the man laughed consumedly when he returned a few minutes later to pick up his passenger, whilst the lady was extremely irate, although she had landed on her feet and was not in the least damaged. My only contribution to this new branch of funny yarns must be that once upon a time I was riding solo behind

**Occasional Comments.—**

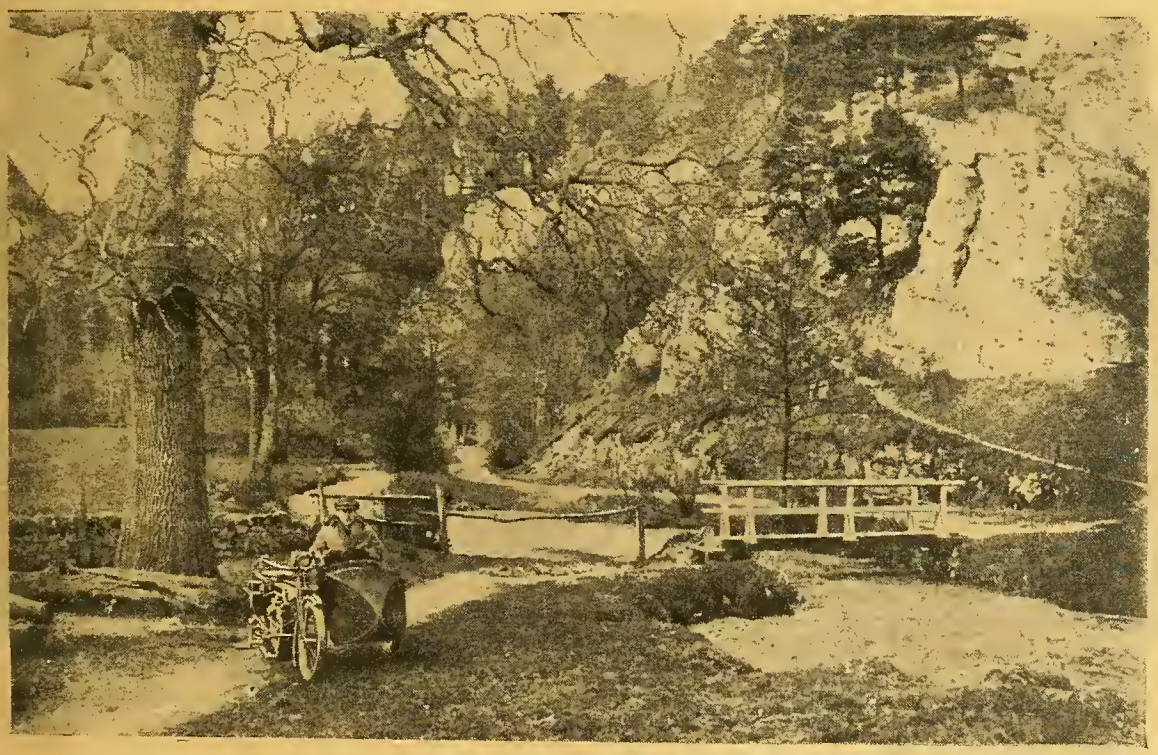
a sidecar when I saw the sidecar wheel detach itself from the axle, run ahead of the sidecar, and finally deposit itself in the ditch. What happened to the outfit meanwhile? Certainly — the driver tilted it over towards the other side, and drove it merrily along poised on the bicycle wheels. After a lively altercation between driver and passenger, the outfit gradually slowed down. At last the bottom of the sidecar touched earth, there was a scrunch and a slew round, after which two frightened and angry men stood in the middle of the road and cursed very solemnly indeed.

## Oversize Tyres.

MY postbag continues to bring testimony that the fitting of 3in. tyres on motor bicycles up to 500 c.c. is the surest method of avoiding punctures and of reducing tyre costs. From a number of letters I cull one signed by Mr. Howard Yeoman, of Madras. He finds it possible to use 28 × 3in. Firestone tyres on Triumph and B.S.A. sidecars. After 2,500 miles the back tyre evinces no perceptible wear whatsoever, and remains untouched. 2,500 miles is a distance which would see a third back tyre of the standard size well advanced in wear on some outfits driven by the engines mentioned. Lots of 500 c.c. sidecar men, using their machines for multi-stop work, find it impossible to get a 2½in. tyre to last 1,500 miles. On all machines which will accept a 3in. cover, the experiment is obviously indicated, and should usually meet the case. Anyhow, there is already a distinct tendency to fitting larger tyres as standard on the so-called dual-purpose machine.

## Ricardo Pistons for Motor Cycle Engines.

SOME years ago I formed what the maidens term a "pash" for steel pistons of the perforated hour-glass pattern. Their sole merits were that they reduced oil friction and lightened the reciprocating parts; so far as cooling went—a very vital point with air-cooled engines—they were probably inferior to the cast iron parts which they replaced; but, nevertheless, they gingered up two or three of my engines very considerably. It follows that when aluminium pistons began to be talked about, and I saw improvements in cooling added to the two merits of the lantern waisted steel piston, I began to get excited. I am not asserting that all my aluminium pistons have proved an unmixed joy. The best aluminium piston is more sensitive to under-lubrication than any of its rivals; and some aluminium pistons are marketed by firms who would be sorely taxed by having to design a boot-scraper. But one or two firms have at last acquired a painful knowledge of the main snags which beset the application of aluminium alloys to pistons, and I rejoice to see that the Ricardo piston is at last standardised to fit all the best-known motor cycle engines. These pistons have figured in most of the finest Brooklands records, and should be of interest to any knuts with ambitions in speed events next competition season. They are not cheap, ranging from 47s. 6d. upwards; but honour is cheaply purchased at that figure, and the man without a Ricardo piston who runs up against the man who has, deserves a licking, and will usually get it. Prolonged track tests by the crack tuners of the motor cycle factories have been a potent factor in the details of the design of these special pistons, which may therefore be regarded as cheap.



Even fairly familiar landscapes assume quite a different aspect when the trees have shed their leaves. The illustration depicts a Welsh beauty spot, which will hardly be recognised by those who have only visited the place in summer. The scene is on the Leeke, between Mold and Ruthin, North Wales.

# 1921 in RETROSPECT

## MOTOR CYCLE HISTORY OF THE PAST YEAR SUMMARISED

### PROGRESS IN DESIGN.

THE motor cycle no longer provides merely a seasonal pastime, for most of us ride throughout the year, summer and winter, wet or fine. Nevertheless, the end of the year and the recent motor cycle Show provide us with an admirable opportunity for studying the progress made in the design of our favourite mounts. Every year the observant will note improvements in detail, though it is but seldom that any radical changes obtain a grip on the buying public in the course of twelve months; rather do the improvements come gradually. Recently we have reached a stage which we have been slowly approaching for some years, when engines of 350 c.c. or less have become acknowledged as sufficient for all normal solo purposes. This is perhaps the most noticeable feature of the year, and proves that engineering progress has enabled our designers to obtain *and maintain* a very much higher power output for a given capacity. The net result is that we are now able to buy lighter, cheaper, and handier machines, capable of as high performance as previous solo models of considerably greater capacity.

#### Greater Comfort.

As a matter of fact, the improvements which have made these facts possible extend also to the larger classes, and the latest big twins are capable of higher sustained speeds and lower petrol consumption than ever before. Of hardly less importance to the average motor cyclist are the improvements in comfort which have taken place since the war. Spring frames, spring saddle suspensions, adjustable footrests, rational footboards, larger tyres, and improved mudguarding, though details in themselves, all help towards the general comfort of the rider, while a new type of vehicle, the open-framed runabout, is being steadily developed, and will provide a means of transport for many business men and elderly persons of both sexes who would be nervous of tackling the normal diamond frame motor cycle.

Perhaps this latter type of vehicle makes no great appeal to the sporting motor cyclist, but we must remember that, in spite of the enormous number of motor cycles on the road, only the fringe of the market has, as yet, been touched; and there are thousands of people who require a safe, effortless, and comfortable means of transit obtainable at a reasonable price.

#### Simplification.

There is a tendency, also, towards simplifying controls, and though this is not as yet very marked, it is of considerable importance. Many prospective purchasers are deterred by the number of controls fitted to the average motor cycle, and, in consequence, single-lever carburetters and automatic oiling systems are steps in the right direction. The ideal machine for the multitude would have but one control in addition to brakes and change-speed lever.

In the matter of reliability we have now reached a stage when any reputable make may be considered as satisfactory under all normal touring conditions.

Again, the low-priced two-wheeler of normal design is making rapid strides, and the day is not far distant when the artisan, living some miles from his daily work, will proceed thither on a simple and foolproof motor cycle well within reach of his purse.

Modern reliability trials have done much to improve the touring machine, but we must not forget the enormous market for the simplest possible machine, which will never be required to tackle a serious hill, and will ultimately replace the pedal cycle to a very large extent. Fortunately, it is clear that some of our designers have this matter in hand, and there has appeared a number of simple two-strokes which are well on the way to achieving this ideal, though there is still some distance to travel as regards price.

One of the bends on six-mile Applecross, which, included in a trial last summer for the first time since 1914, demonstrated the motor cycle's progressive improvement in efficiency during that period.

## COMPETITIONS ON ROAD AND TRACK.

IN THE A.C.U. SIX DAYS TRIALS.
(Left) Competitors lined up at Brooklands preparatory to their start on the open road.
(Above) Sidecar competitors passing through Yeovil.

FROM all points of view what may be called the sporting side has enjoyed a wonderful year in 1921.

There are still people who cannot understand why competitive motor cycling should be regarded as a sport. They imagine that the personal element affects very little the success or otherwise of a particular machine in a reliability trial, race, or similar event. Of course they are wrong. One has only to consider the entry lists—more often than not record entry lists—of last year's competitions to prove them so.

It is admitted now that there were too many "open events" in 1921; yet only a negligibly small proportion failed to achieve remarkable success. The number of amateur riders, who gravitated from participation in their local club "prowls" to an endeavour to win honours in the classic affairs, was, in no small degree, responsible for the record interest and support bestowed on competitions which justified inclusion in our "Important Dates" column.

There is another aspect to the question, however—in some respects a more important one. The sporting appeal may be likened to the sugar coating; the pill is intended to cure weak designs. And if it does not cure, it certainly kills.

For the purpose of review, last year's competitions may be divided into two arbitrary sub-divisions—reliability trials and speed events (the latter including races, hill-climbs, timed speed trials and records).

### RELIABILITY TRIALS.

THEORETICALLY the English Six Days Trials rank as the most important of the year. In a commendable attempt to make them more useful, however, the A.C.U. decided to include fuel consumption, brake, silence, and speed tests, with the two-fold result that many important manufacturers withheld their support on the score that they objected to being dictated to, and that the road portion of the trial became too ridiculously easy, both from the sporting riders' and the spectators' points of view. Porlock and Lynton were the worst, almost the only hills, and, as it refused to rain, not many marks were lost on the score of hill-climbing. The Brooklands speed test, on the other hand, provided several eleventh hour surprises. New Imperial, A.J.S. (two classes), Rover, and P. and M. won the coveted team awards.

In entry, in difficulty, and in interest, the Scottish Six Days event, organised by the Edinburgh M.C. during the hottest week in summer, took a premier position. Dry weather until the last day cheered the competitors and disappointed the club; but one or two new mountaineering "finds"—including the seemingly never-ending Cork-screw at Inverfarigaig—and the reappearance of some old friends in the shape of the six-mile Applecross and the deceptive Glendoe, more than equalised matters. Prospective buyers should look down last year's Scottish award list; only good riders on sound machines gained "golds." Sunbeams gained the team prize and generally made an excellent showing.

#### On the Continent.

It is a pity that the third long-distance trial of the year was not better supported, for the International event, held in Switzerland at the beginning of August, offered climbing tests of a severity that Great Britain cannot provide. Switzerland again won the International Trophy, but outstanding performances were made by individual British riders.

Much of the above comment applies also to the Paris-Nice Trial. The previous year's *débâcle* provided a possible reason for the absence of British entries; but, as it turned out, the organisation was quite good.

Of the multitudinous one day open trials, the A.C.U. event in April, which included a class for stock machines, deserves special mention. It was not of great severity, but finished with a speed test at Brooklands. The result was curious; forty-three "ordinary" and seventeen "stock" machines started; sixteen and ten respectively gained first class certificates. Raleigh, Humber, Triumph, P. and M., Norton, Levis, A.J.S. sidecars (two), and Morgans (two), were the successful ten.

The spring trials proper started earlier than this—on March 10th to be exact—with the classic, if closed,

**1921 in Retrospect.—**

Colmore Cup Trial of the Sutton Coldfield Club. 158 entries, good weather conditions, but considerable rusty driving were the salient features. Of the same nature, but slightly more difficult, was the Birmingham M.C.C. trial for the Victory Cup. The Old Wyche (possibly for the last time) caused few failures. O. Hayes (3½ Sunbeam), an amateur rider, and Bert Kershaw (2¾ Verus) were the respective trophy winners in these two events.

Easter brought the Richmond Meet and the first of the M.C.C.'s big 1921 events—the London-Land's End *Run*. With an 18 m.p.h. minimum over Porlock and Lynton, and some rain, most of the competitors considered that the M.C.C. was unduly depreciatory. The Jarrott and Captain's Cups were won by F. A. Longman (3½ Ariel) and F. W. Giles (7 A.J.S. sc.) respectively.

held a team trial, dammed watersplashes (the competitors would have substituted an "n" in the adjective) causing much unfavourable comment.

In quick succession now came the Arbuthnot Trophy Trial—a naval officers' joy-ride—won jointly by Lieutenant T. H. Back (4 Triumph), C. Plumer (3½ Sunbeam), P. V. James (5 N.U.T.), and Sub-Lieut. H. C. Chads (4 Triumph), and an open trial at Bournemouth with a novel "observed driving" test.

### Ilkley and North Wales.

Clashing with the Scottish Six Days, the Ilkley Trial nevertheless attracted sixty-eight sportsmen, who knew what to expect—and got it. F. W. Giles (7 A.J.S. sc.) made "the best individual performance." Alt-y-bady and an absurd watersplash darkened the clean sheets of seventy-six out of ninety starters in a North Wales open event three weeks later, when G.

At the start of the Junior T.T. race—"No. 1" has got the word go. (Insets, from left to right) H. R. Davies (2¾ A.J.S.), Eric Williams (2¾ A.J.S.), and D. Prentice (2¼ New Imperial), the winners of the Senior, Junior, and 250 c.c. classes respectively.

Because it was a two-day event, the trade refused support to the enterprising Western Centre's trial on April 8th and 9th. No fewer than nineteen club teams alone agreed that it was a most enjoyable and sporting affair. Awarded for the most outstanding performance, the White Challenge Cup went to A. T. Colcombe (4 Indian).

### Nine Hills in Twenty Miles.

A fortnight later, the Midland Centre succeeded in staging nine nearly-freak climbs in twenty miles in the course of a stiff day around Stroud. Next week the Newcastle and District M.C. shared two open permits with the Ealing Club, which chose London to Holyhead.

More records were broken by the M.C.C. London-Edinburgh run at Whitsun, made more difficult by the inclusion of Buttertubs Pass.

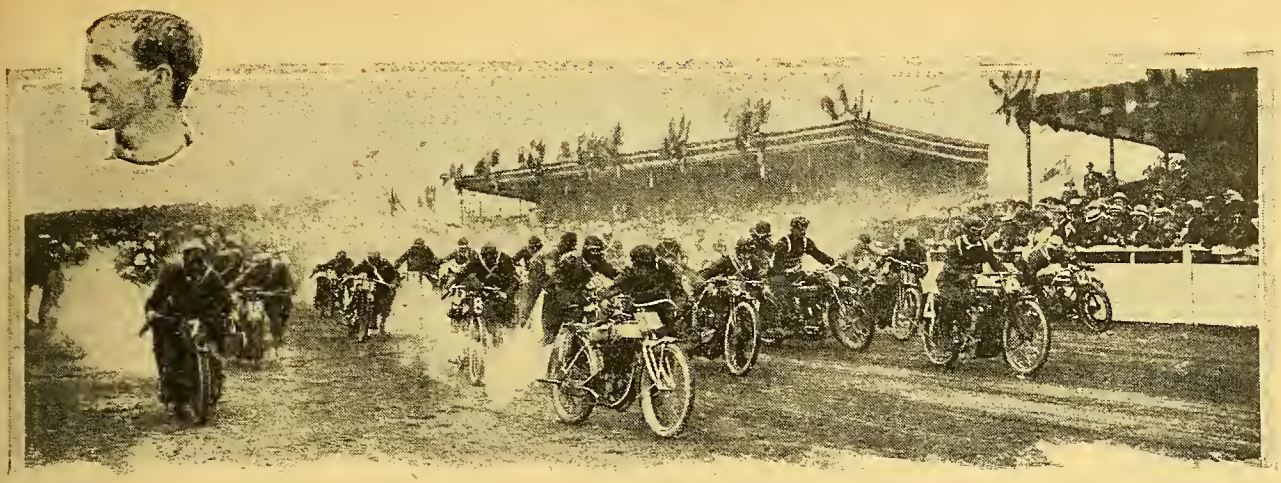
Then, a pause for the T.T., and the Sheffield and Hallamshire M.C.C. won the M.C.C. club team championship, taking home *The Motor Cycle* Cup for the second time. On the same week-end the N.W. Centre

F. Burns (3½ Sunbeam) scored another amateur's success by annexing four of the chief awards; and, on the Saturday after, Wrynose Pass proved just as deadly in a Cumberland event. Bert Kershaw added to his and the New Imperial's laurels in this case. Wonderful weather saved (or ruined, according to viewpoint) the Liverpool M.C. Reliance Cup Trial, the actual route being quite as difficult as the earlier North Wales scramble. Reg. Brown (3½ Sunbeam sc.) and G. W. Shepherd (8 Excelsior sc.) tied for the Reliance Cup.

On the following week-end the Edinburgh M.C. "released" a wonderful hill in a local park for the benefit of returning competitors in the Scottish Two Days Trial.

Towards the end of September a team of English riders, at home, easily beat the representatives of Holland. Birdlip caused many Dutch failures. On the same week-end the M.C.C. proved that Kent has possibilities for a solo machine trial.

Fifty heroes faced the starter in the Scott Trial, "open" only in that open country was traversed; October failed to provide real October weather,



As a contrast to the picture on the preceding page, this scene at the simultaneous start of all the 500 c.c. machines in the Grand Prix is illuminating. (Inset) A. Bennett (3½ Sunbeam) the winner.

however. J. Whalley, of T.T. fame, this time on a Sunbeam, won the amateur class, and C. P. Wood (3¾ Scott) the trade prize. Next Saturday was summer-like, but the M.C. and A.C. found more precipices around Stroud than the local goats knew of. W. B. Gibb (3½ Douglas) was the star performer, consequently gaining the M.C. and A.C. Trophy.

A little more rain would have made High Oak even more interesting in the early November West Midland Trial, but the observers had far from a dull time as it was. Ariel and Sun-Vitesse teams tied for *The Motor Cycle* award; the Norton private owners' prize went to L. Crisp (4½ Humber).

There were two Christmas holiday events—the classic London-Exeter run of the M.C.C. and the open twelve hour London-Gloucester-London trial of the North-west London M.C.C. Both received most encouraging support, and the M.C.C. run in particular, aroused great public interest. Weather conditions were what might have been expected, but there was a good proportion of finishers

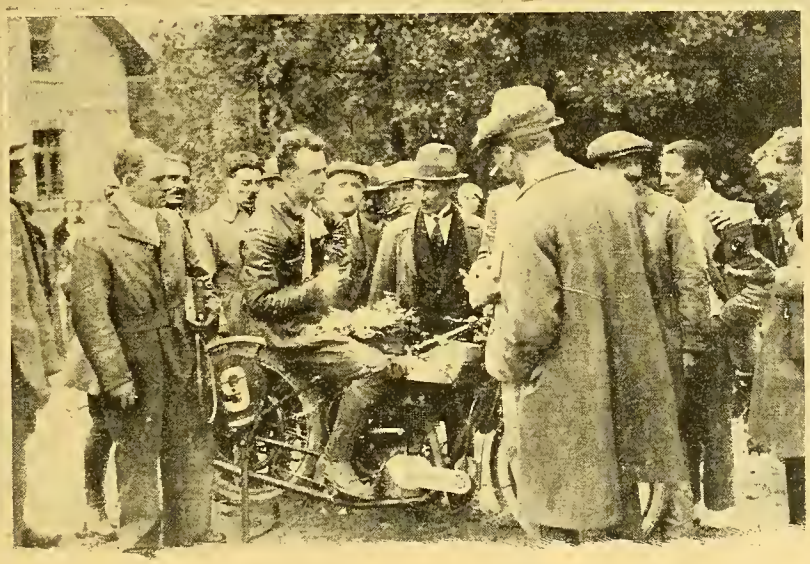
## SPEED EVENTS.

### Road Racing.

UNQUESTIONABLY the most important motor cycle speed event in the world, the T.T. races in the I.O.M. last year produced some sensational results. J. Whalley, on a 2¾ h.p. o.h.v. Massey-Arran, made a lone but stirring fight in the Junior Race against five A.J.S. lightweights. Misfortune overtook him in the last lap, while he was still a possible winner, and Eric Williams, on one of the Wolverhampton machines, won, for the second time in his career, at the record speed of 52.1 m.p.h. Douglas Prentice, on a 2¼ h.p. New Imperial, secured victory and *The Motor Cycle* Cup for a four-stroke in the 250 c.c. class.

After running second for a number of laps to a variety of leaders, H. R. Davies, on a 350 c.c. A.J.S., beat every 500 c.c. machine in the Senior Race at the remarkable, and again record, speed of 54.49 m.p.h. F. G. Edmond (3½ Triumph) made the fastest lap at 56.44 m.p.h., but his luck did not hold and he failed to finish earlier than seventh.

Two Sunbeams, ridden by A. Bennett and T. C. de la Hay, made a clean sweep of the French Grand Prix at Le Mans; and H. Hassall, on a Norton, secured a noteworthy win in the corresponding Belgian event, bringing a Continental award to Birmingham. Thus British machines proved their superiority in the three great international road races.



BRITISH VICTORY IN BELGIUM.

H. Hassall (3½ Norton), snapped immediately after winning the Belgian Grand Prix Race

### Brooklands Racing.

On the track it was a year of unparalleled activity, and, to give due credit to every more or less outstanding success, would require the best part of this issue of *The Motor Cycle*. Taking, therefore, the "more" noteworthy achievements, the 500 Mile Race cannot

**1921 in Retrospect.—**

lightly be dismissed. It was the first long distance event of its kind, and proved an immense success.

The Miller Gold Cup, the premier award, for the first man home irrespective of class, went to H. Le Vack, who piloted a 7-9 h.p. Indian over the distance that London is from Perth at an average speed of 70.42 m.p.h. An amateur rider, E. W. Parham, on a 5-6 h.p. flat twin Coventry-Victor, led the 750 c.c. class at 56.00 m.p.h., but V. Horsman's 490 c.c. Norton, which won the hotly-contested 500 c.c. class at 62.31 m.p.h., was faster. A 2¾ h.p. Ivy two-stroke, ridden by N. Norris, and a 2¼ h.p. New Imperial, with

1921 (published on December 15th, 1921) reveals many changes and, an encouraging point, a considerably greater variety of names—both of riders and machines. Records are far from being anybody's monopoly nowadays.

A speed of 100 miles an hour on a motor cycle was for the first time recorded in this country, when, towards the end of April, D. H. Davidson, on a 7-9 h.p. Harley-Davidson, just succeeded in exceeding the magic figure. On the very next day, however, Le Vack attained no less than 106.52 m.p.h. on an Indian, and has more recently increased this to 107.55 m.p.h. In the 500 c.c. class R. N. Judd (Norton) topped ninety

FIVE HUNDRED MILE RACE.

Over fifty competitors starting on their Marathon around Brooklands track—a striking spectacle. Below are the winners of the five classes and their speeds :

H. le Vack (7-9 Indian) 70.42 m.p.h. | E. W. Parham (5-6 Coventry Victor), 56.00 m.p.h. | V. Horsman (3½ Norton), 62.31 m.p h. | N. Norris (2¾ Ivy), 51.69 m.p.h. | Bert Kershaw (2¼ New Imperial), 50.34 m.p h.

Bert Kershaw "up," were first in their classes at 51.69 and 50.34 m.p.h. respectively. Three Martinsydes gained the team prize.

### B.M.C.R.C. Meetings.

B.M.C.R.C. meetings at Brooklands took place approximately once a month, and, towards the end of the "season," scratch championship races were held. Extraordinarily keen finishes were the rule, and, therefore, considerable credit attaches to the "champions," who are : J. V. Prestwich (2¼ Diamond-Jap), E. Remington (2¾ Blackburne). J. Emerson (3½ Douglas), C. G. Pullin (6 Douglas), and C. F. Temple (7-9 Harley-Davidson) in the solo events, and D. R. O'Donovon (4 Norton sc.) and C. F. Temple (7-9 Harley-Davidson sc.) in the sidecar heats.

### Records.

Records have been broken in a wholesale fashion, and a comparison of the list (published on January 6th, 1921) of 1920 with the corresponding table for

for the first time, but G. Dance, on an o.h.v. Sunbeam, has since sent this up to 93.99 m.p.h.

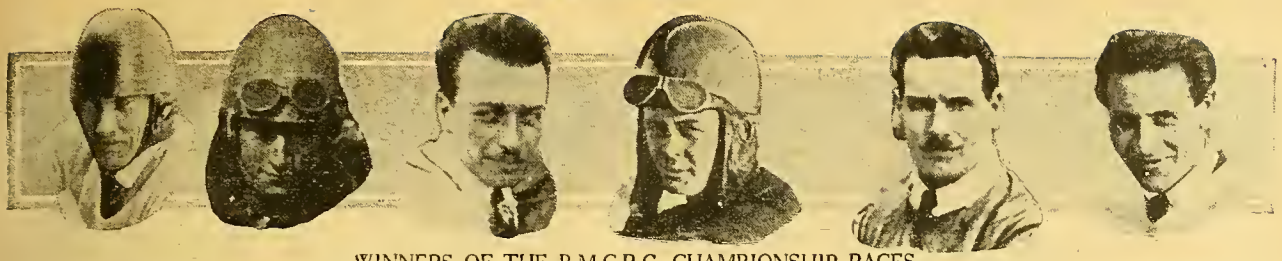
For the first time in history a four-valve single holds the much-coveted, and, consequently, the much-broken, 500 c.c. hour record, F. B. Halford, on an o.h.v. Triumph being the successful rider. There are now, too, a couple of times in the 750 c.c. class, made by H. H. Bowen (6 Martinsyde), which beat the hitherto all-conquering "3½'s."

Two-strokes hold a much stronger position than at the end of 1920, fine records standing to R. N. Judd and D. R. O'Donovon (Velocettes), N. Norris (Ivy), and J. F. Newey (New Comet-Climax sc.).

New Imperial, A.J.S., Douglas, and Norton are, of course, well represented, in addition to the makes already mentioned.

### Speed Trials and Hill-climbs.

As a general rule speed trials and hill-climbs are almost identical events, and last year they attained



WINNERS OF THE B.M.C.R.C. CHAMPIONSHIP RACES.

D. R. O'Donovon (4 Norton)—600 c.c. sidecars

C. G. Pullin (6 Douglas)—750 c.c. solo machines.

J. V. Prestwich (2¼ Diamond-Jap)—250 c.c. solo machines.

C. F. Temple (7-9 Harley-Davidson)—1,000 c.c. sidecar and 1,000 c.c. solo.

E. Remington (2¾ Blackburne)—350 c.c. solo machines.

J. Emerson (3½ Douglas)—500 c.c. solo machines.

great popularity, notwithstanding the fact that the real thrill of racing is usually absent. This latter criticism does not apply, however, to meetings on the sands, where scratch races were actually staged, such as—a typical example—the Welsh open championships at Pendine Sands on August 25th. Scotland, too, held speed championships on the Saturday before the Scottish Trials.

With well over a dozen open timed speed trials or hill-climbs, and one or two of them with thirty to forty classes, it would appear, at first sight, difficult to pick out the most successful riders. However, as George Dance, on his wonderful Sunbeam, almost inevitably made fastest time of the day, he stands out most distinctly as the premier rider in this class of event. At the Norfolk Open Speed Trials on September 8th he more than once streaked down the dusty course at over 90 m.p.h. H. Le Vack (Indian), who won *The Motor Cycle* Cup at the Doncaster event later in the year, and G. W. Walker (3½ Norton) have also both gained a valuable collection of premier awards at these events; and there are twenty or so other names that immediately occur in seeking to honour our speedmen.

During the year the records for Sutton Bank, Style Cop, Kop Hill, and Penkridge Bank have all been bettered.

No wonder 1921 has been called a speed year.

## MOTOR CYCLES AND THE LAW.

THE year 1921 opened with a new system of taxation for all classes of motor vehicles. The owner of the lightweight came off fairly easily, and only had 10s. added to the £1 he had to pay previously, but the owner of a motor bicycle weighing over 200 lb. was mulcted of three times the original fee, and he had to pay £1 extra for the privilege of drawing a sidecar. This means that the rider of a machine of average weight has to pay three times the amount he was forced to contribute before the new regulations came into force, but even then his fate is a great deal better than that of the car owner, as the initial motor cycle tax was proportionately small. Of course, the consequent elimination of the petrol tax of sixpence per gallon was decidedly beneficial to all motorists, especially those whose mileage is extensive.

So far as the year 1921 is concerned, the taxation scheme appears to have worked smoothly, and we rarely receive letters from readers who have difficulties with the taxation authorities; only occasionally do we hear of cases of motor cyclists failing to understand the use of the registration book, which has to be forwarded to the registration authority so soon as a change of ownership takes place.

In August last an order was made rescinding the war time lighting regulations, with the result that not only pedal cycles but solo motor cycles as well were allowed to dispense with their tail lamps. Now, from the motor cyclist's point of view this was undoubtedly a saving of trouble and a great blessing, but from the point of view of other road users it is a severe disadvantage. Every motorist who has any consideration for himself and other people using the King's highway must know how dangerous it is to overtake a vehicle the rear of which is not illuminated in any way, and how many an accident has occurred through neglect of this precaution. It is hardly to be conceived, therefore, that the authorities will allow this state of affairs to continue much longer. But to deal with the present:

RECORD-BREAKERS OF NOTE.

F. B. Halford, holder of the 500 c.c. hour record, on a four-valve Triumph.

D. H. Davidson (7-9 Harley-Davidson), the first British motor cyclist to attain 100 m.p.h.

Geo. Dance, who has recorded 93·99 m.p.h. on a 3½ h.p. Sunbeam.

J. F. Newey (2¼ New Comet Climax sc.), the only holder of sidecar records on a two-stroke.

R. N. Judd (3½ Norton), who first exceeded 90 m.p.h. on a 500 c.c. machine.

1921 in Retrospect.—

cases have occurred of motor bicycles being stopped by the police for not carrying a rear light, but we have been unable to trace cases of actual fines being imposed for this alleged offence, and certainly no test case has been fought by any of the motor cyclists' organisations, though we know that they would be ready and willing to take up a matter of this kind on general principle.

### Speed and Silence Requirement.

There is one point for which motor cyclists may be truly thankful, and that is the practical disappearance of the speed limit police trap. Police persecution is not yet a thing of the past, but it is nice to know that if the average motor cyclist drives carefully in congested areas he need not fear any trap on the open road. The fact, however, remains that the police are in certain districts extraordinarily strict as regards silencing, and we must say that in many cases their action is only too well justified. Undoubtedly, motor cyclists are themselves to blame, as many love the healthy bark of a well-tuned engine, which, unfortunately, is the one thing which the general public absolutely detests. The manufacturers are also likewise in the wrong for aiding and abetting these noise enthusiasts by turning out and selling machines which must of necessity be inadequately silenced. It was definitely established at the last A.C.U. Silencer Trial, held in 1913, that the ideal silencer was as large an expansion chamber as can be fitted and a long exit pipe, such a device giving practically no back pressure and considerably reducing the noise of the exhaust gases. At ordinary speeds, however, there are many machines which are extremely quiet with a "straight through" exhaust pipe. If a machine can be silenced without losing power, there surely can be no objection to rendering the exhaust reasonably quiet, provided the owner obtains the liveliness and speed he requires.

## THE OUTLOOK.

TURNING from the retrospective to the future, the outlook for 1922 is brighter than the most sanguine prophet expected it to be a few months ago. There is a genuine note of optimism in all motor cycle circles, which is the outcome of the Olympia Show, at which it was proved that public interest in motor cycles is greater than ever. This is confirmed by the fact that the circulation of *The Motor Cycle* Show number was over 140,000—a sign of its popularity as well as of the enthusiasm for the machines with which it deals.

It is now fully realised that almost any good make of motor cycle may be regarded as reliable, and that the motor cycle provides the most economical form of mechanical transports for one person or whole families. It is no longer exclusively classified among sports and pastimes, for the motor cycle is already a utilitarian vehicle as well as a means of providing the youth of this country with a fascinating and health-giving pastime.

Prices for 1922 are considerably below those obtaining twelve months ago, and the public which withheld purchasing last year owing to the falling prices has now greater confidence that prices are definitely stabilising.

On every hand we hear expressions of satisfaction with the prospects for the New Year, and already vacant places are being filled in motor cycle factories, which gradually alleviates the unemployment problem. The prospects of a peaceful Ireland, again, also are having a beneficial effect, and, altogether, the outlook for 1922, so far as the motor cycle movement is concerned, is better than was anticipated, and may be regarded as satisfactory.

# MOTOR TAXATION.

## Estimated £5,000,000 Excess in Two Years.

IT is sometimes overlooked that, whilst the financial year for ordinary taxation begins in April and ends in March, the financial year for motor taxation licences ends on December 31st. If, therefore, any alteration, either in principle or detail, is to be secured for 1923, statutory authority must be obtained by the Finance Act, 1922, which will be originated by the introduction of the Budget in April next.

From August, 1915, to March, 1920, the State benefited to the extent of £12,700,000 from special taxation, which at the outset was specially earmarked for the roads. The sum of £8,250,000, which was transferred from the Treasury to the Road Fund at the end of the war, was not in the real sense a set-off against these diverted revenues. It was a contribution in respect of road depreciation due to war conditions.

Even assuming the contrary, the Exchequer made a profit of nearly four and a half millions from motor taxation during the war period.

What was the estimated revenue required, what, on the latest figures, is the yield of taxation, and what is likely to be the yield for 1922?

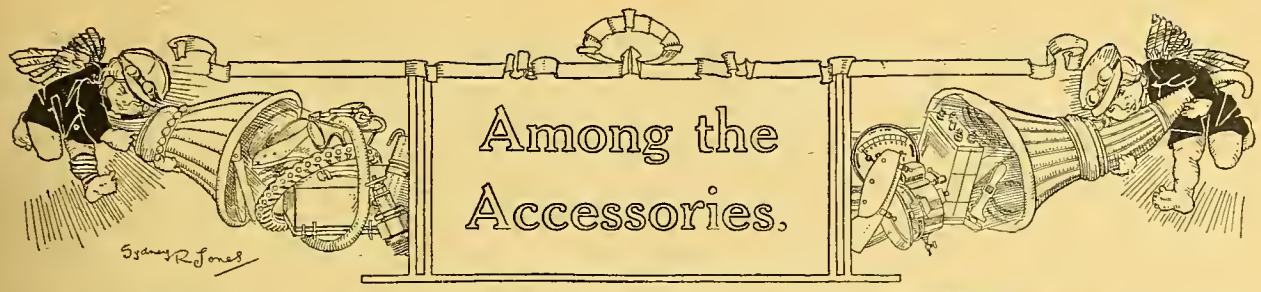
The second paragraph of the report of the Departmental Committee states that the problem was to raise "an annual net revenue, provisionally estimated at £7,000,000." That was the task set the Motor Legislation Committee. This £7,000,000 net became £8,000,000 gross after adding the costs of collection and the sum to be paid local authorities in lieu of carriage licences. By the end of November—that is, after eleven months' operation of the scale—the gross yield exceeded £10,500,000. It is reasonable to assume a gross yield of £11,000,000 for the full year.

The highest estimates of the Chancellor of the Exchequer and of the Ministry have never assumed a greater gross yield than £9,025,000. On April 20th, 1920, Sir Eric Geddes stated in the House of Commons that "£7,000,000 or £8,000,000 a year is necessary," and on April 27th that the object is "to raise, roughly, £8,000,000 a year." Therefore, on the highest estimate of the sum required, there will be this year an excess of nearly £2,000,000.

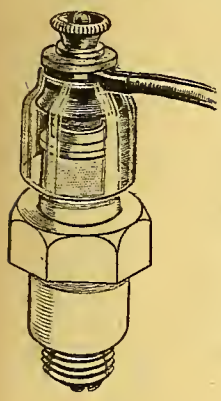
What of 1922? As the present scale of taxation cannot be altered during that year, an increase of a million over the 1921 yield is probably an under-estimate. An excess of £5,000,000 in two years may be regarded, therefore, as a certainty.

Opinion amongst manufacturers, dealers, and users of private and commercial vehicles is practically unanimous that, apart from the unjust and anomalous incidence of burden inseparable from the present system of taxation, the scale upon which the duties are levied has produced already a serious restriction upon the development of mechanical road transport.

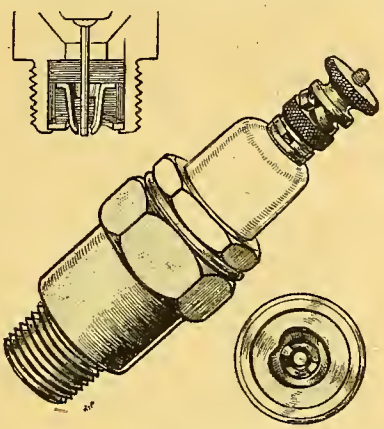
The Motor Legislation Committee is working hard to secure an alteration in the taxation scheme, but prospects are not hopeful unless all sections of motor vehicle owners unite for the presentation of an agreed case for consideration by the Government Departments concerned in the early days of this year.



## Combined Waterproof Terminal and Spark-gap.

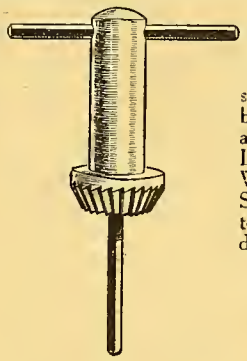


By means of an insulating bush in the "Sparxsekas" terminal, the h.t. wire is insulated from the central electrode, but a spark gap is provided inside the glass dome, the spark being visible although totally enclosed by the chamber. The gap is adjustable by means of washers. (Clifford Pressland, Hampton-on-Thames.)



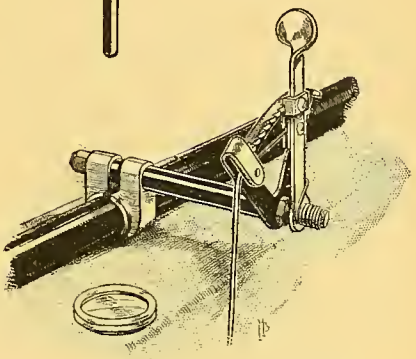
## To Prevent Oiled Plugs.

As the upper section of the electrodes, etc., shows, the Dome plug embodies a spark-gap actually at the firing points, since the current has a double gap to jump before it reaches earth. The plug may be entirely dismantled for cleaning. (Roth and West 67, Cowley Road, London, S.W.14.)



## Renewing Valve Seats.

For re-cutting valve seats, this tool is made by the Motor Gear and Engineering Co., Ltd., Kingswood Works, High Road, Seven Kings, Essex, to suit a variety of different engines

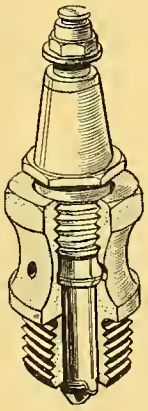


## When the Throttle Wire Breaks.

Ultra-cautious motor cyclists will welcome this device which is intended to be carried in the tool-bag until the throttle or clutch wire breaks. (Watkinson and Northedge, Palatine Villas Morton near Alfreton.)

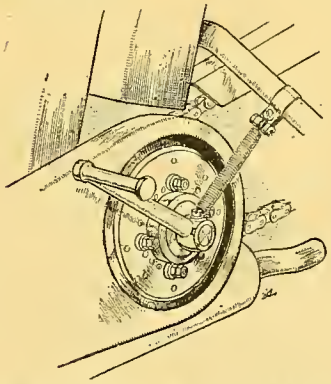
## Easy Starting and Economy.

Simply a handle-bar controlled extra air valve surrounded by absorbent material, the Atomiser Co.'s (East Belden, Durham) Economiser may also be soaked with petrol to act as a priming device



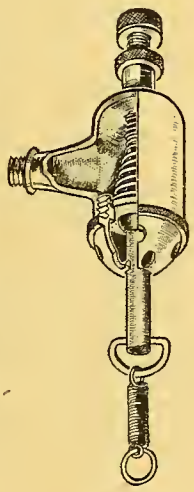
## An Air-cooled Plug.

With an enormously stout central electrode and air-cooling holes in the body, the J.A.M. sparking plug should never become excessively hot. (The Hobson Manfg. Co., 29, Vauxhall Bridge Road, London, S.W.1.)



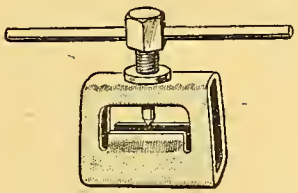
## Kick-starter for an Old Machine.

Working on a simple ratchet principle, this kick-starter has been specially designed for the old type two-speed Indian machines. It fits on the outer clutch plate, and it is only necessary to send this when ordering. 50/- (C. Hopkins, 283, Foleshill Road, Coventry.)



## An Automatic Extra Air Inlet.

At small throttle openings, when the suction in the induction pipe is greatest, the Empire extra air valve automatically admits extra air. It may be hooked out of action if required, by the coil spring and loop provided. (New Motor Speciality Co., Ltd., 113, Oxford Street, London, W.1.)



## Simple and Neat.

Nothing could be simpler than the chain rivet extractor supplied with all three-speed Rudge machines

# LONDON-EXETER-LONDON.

## Record Success of the M.C.C. Classic Holiday Trial. Mixed Weather and a New Hill.

"THERE you are, then!" The idiotically popular catch-phrase of the moment, echoing and re-echoing among a 300 strong crowd of strangely garbed motorists at and around the Bridge House Hotel, Staines, very appropriately expressed the spirit of the occasion—the start of the M.C.C. London-Exeter-London run on Monday night last week.

The 1921 event assumed more than ever the nature of a gigantic re-union of the keenest motor cyclists in the country. One must be keen to leave a cosy fireside on Boxing Day for the purpose of riding through the night to Exeter, then back, under proverbially severe weather conditions, and by no means over the easiest route.

The assembly at Staines, where the start of the trial was made at 8 p.m.

### High Proportion of Finishers.

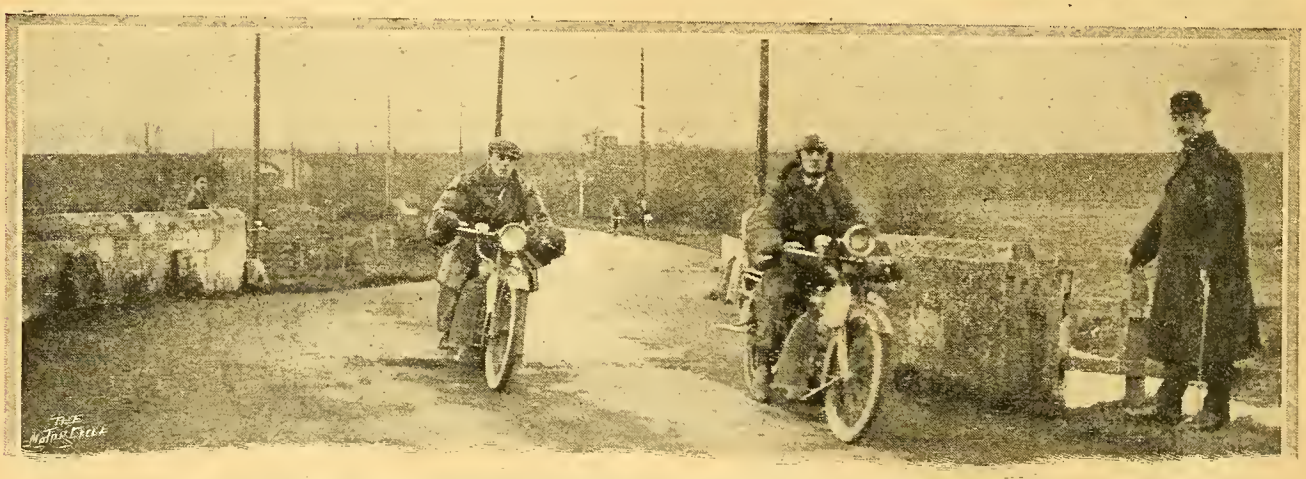
Exactly 200 hundred drivers of solo machines, sidecars, or three-wheelers, as indicated by the entry list, decided to include a mass visit to Devonshire in their Christmas festivity programmes; and 186 actually started—64 solo, 107 sidecars, and 15 three-wheelers. Of these no fewer than 151 (49 solo, 89 sidecars, and 13 three-wheelers) checked in at the finish on the following night, although one or two of these "finishers" had gone no further than Salisbury!

It did not actually rain at the start, and some were rash enough to hazard that the long run of suitably wet Boxing nights was at last to be broken. Few of these false prophets were taking any risks in the matter of clothing, however, and if the members of the general public who lined the starting point in two long avenues were entirely disinterested in motor cycles (which, emphatically they were not), they would have spent an interesting time in viewing the variegated clothing schemes. Nevertheless, here and there, were heroes, obviously new to the run, who had casually flung on old coats on the basis perhaps that they had proved effective in the past during an afternoon's summer rain.

The machines and their lighting arrangements were also very varied. Brand new, old, and old and obsolete outfits were indiscriminately formed two-deep in a long line leading to Mr. Bidlake's car, when A. C. Rhodes on a four-valve Triumph, looking "straight from the crate," and G. E. Cuffe (2½ Metro-Tyler) received the word to go. Thereafter the remainder were despatched in pairs at one-minute intervals, having survived a battery of flashlight photographers, dismal farewells from friends, who were "going by car for a change this year" (!), and queries of "What petrol (carburetter, plug, or chest-protector, etc.) are you using?"

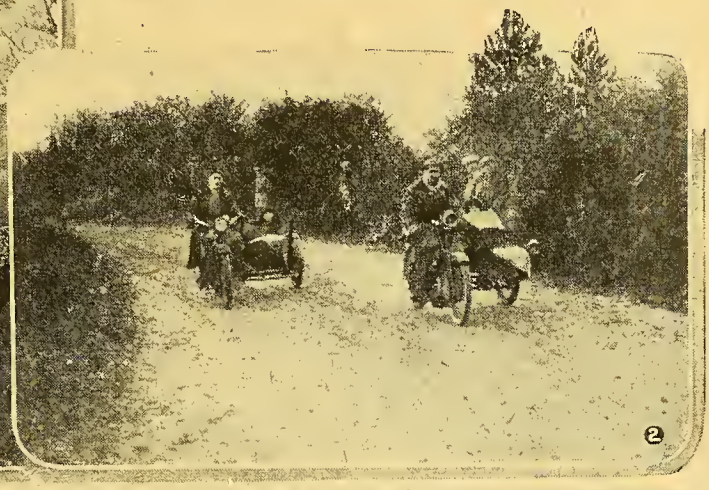
### Born 1899, still going Strong!

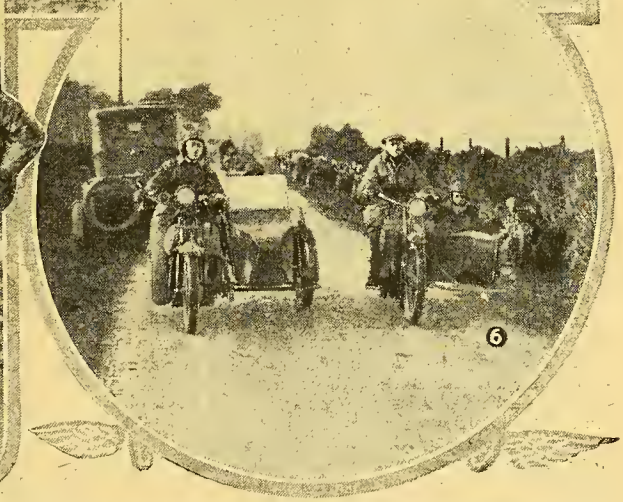
B. F. C. Fellowes' 2¾ h.p. De Dion Bouton (*"ne fronti credé"*) of 1899 vintage was undoubtedly the oldest machine, but it was too well modernised to be the least modern. For example, W. Hill's 8 h.p. Chater-Lea sidecar outfit was very much pre-war, and, despite a carrier that came "unstuck" every quarter of an



V. Gayford and F. C. Townshend, both riding 3½ h.p. Zenith-Bradshaw machines, leaving Salisbury

# Passenger Machines on Salcombe.





(1) C. E. Bennett (8 Morgan) followed by two more three-wheelers. (2) Extreme types, both climbing well—C. Nott (7 Matchless sidecar) and G. F. Mason on a 375 c.c. Connaught outfit. (3) The re-designed 4 h.p. Douglas makes a fine ascent in the hands of G. Kuhn, who has just overtaken W. Hill (8 Chater-Lea sidecar). (4) W. Joyce's Grand Prix Morgan passes two less successful sidecarists. (5) Smiling competitors in the check at the top of the hill. (6) On the level once more, just beyond Salcombe—F. W. Giles (7 A.J.S. sidecar) and H. L. Miserey (7 Matchless sidecar).

**London-Exeter-London.—**

hour or so, with the inevitable consequences to a cheap acetylene tail lamp, it completed the run with remarkable consistency, failing only on Salcombe.

E. H. Fielden's belt-driven Norton also had obviously seen several summers since it left a showroom; in this case a Mabon gear gave a low ratio of only 8 to 1, but Fielden was observed in trouble early in the night, and he failed to finish. There were also several fairly ancient Triumphs and a far from new 2¾ h.p. Zenith.

### Interesting Entries.

Among the other machines that attracted special attention were: S. S. Debenham's 10 h.p. Campion, which was fitted with a Jardine four-speed gear box; J. Wallis's 7-9 h.p. Reading-Standard, which hauled two full-sized passengers in a Plus One sidecar; Neville Hall's little two-stroke O.K. outfit, upon which he made a star performance; the 4½ h.p. Beardmore-Precision, driven by Eli Clarke, jun., who, however, experienced much bad luck; and the three Ner-a-cars.

There was no unanimity in lighting equipment. The general idea appeared to be to mount as many lamps as possible on the available space, although more than one of the solo men were content with a single acetylene head lamp fed by a solitary standard generator.

Since, including cars, the procession of competitors extended to nearly sixty miles along the road, it is impossible to say definitely where and when it started in real earnest to rain. But nobody crossed Salisbury Plain without getting his share, and, for most, those dreary stretches before and after the supper stop at Salisbury itself were a continual battle with the elements. A high-pressure gale from a threequarter front direction bore the water in sheets against the riders, made driving almost dangerous for the soloists and most unpleasant for all, and ruined the reputations of several waterproof coat manufacturers.

Curious things began to happen to the machines. For example, J. A. Watson-Bourne's Brough Superior has a saddle tank, underneath which are carried the high-tension leads to the plugs; water drained in and a concealed "short" developed, which took quite a lot of unearthing (no pun!). A. C. Rhodes (o.h.v. Triumph) repeated his Land's End mishap, and took rather a nasty toss.

Onwards to Yeovil lone enthusiasts here and there kept vigil by the roadside, but mainly it was rain, and then more rain. Hot coffee, as usual, at Moffatt's garage was something to look forward to; then even the weather gods cheered up, and when Chard Hill was climbed (by 99% successfully) it was once more dry overhead. There was a check at the summit, and another at Honiton.

Peak Hill, ascended just before dawn, was in an extremely bad condition, and skids and wheel slip respectively caused many solo and sidecar failures. Parsons chains saved several of the small three-wheelers. Peak was not a non-stop section, but the usual check at the top suitably penalised most of the failures.

Much of the next thirteen and a half miles to Exeter consisted of extremely slimy, narrow, and twisting lanes, and falls were common occurrences.

Two hours and a quarter were allowed for breakfast, and a start was made on the return journey. Forebodings regarding Salcombe Hill proved not unfounded. Although greasy in patches, it is far from being a freak hill, and failures, except from balking, were in most cases inexcusable.

The O.K. sidecar outfit again distinguished itself with a slow but very sure climb, in contrast to one or two of its immediate predecessors and followers, notably A. P. McGowran (4 Triumph sc.), who changed up just after the steepest portion, and C. G. Pullin (6 Douglas sc.). Most of the horde of Matchless sidecars toyed with the hill, but no more effectively than W. C. Hemy's 2¾ h.p. A.J.S. outfit or G. R. Claridge's Triumph. The 350 c.c. Ivy outfit, driven by P. A. Hopkins, was also very sure of its capabilities.

Among the soloists, the lightweights were both best and worst, although the majority of those that were fully expected to fail had retired long before! Except-

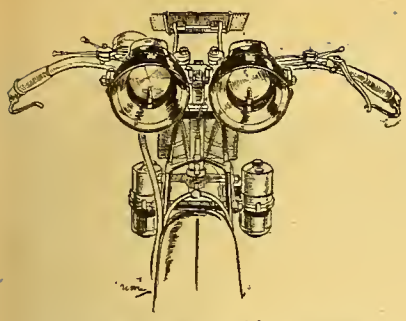
ing W. E. Line's New Hudson and one of the L.S.D.'s, all the three-wheelers (mainly Parsons-aided) were good. Failures here, by the way, were penalised irrespective of arrival time at the subsequent check.

### Improved Weather.

Last year's route was rejoined a mile or two further on, and through Lyme Regis, Dorchester, and Blandford to the lunch stop at Salisbury bright sunshine cheered the sleepy drivers and warmed the sleeping passengers.

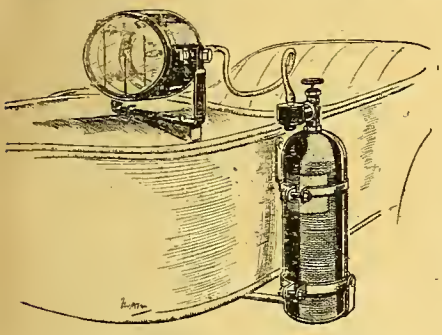
Little batches of local motor cyclists were congregated on almost every upgrade to witness the passage of the competitors, and by the eager way in which they followed every movement they were obviously making most absorbing comparisons of the various machines' "hill-

## DETAILS OF INTEREST ON COMPETING MACHINES.

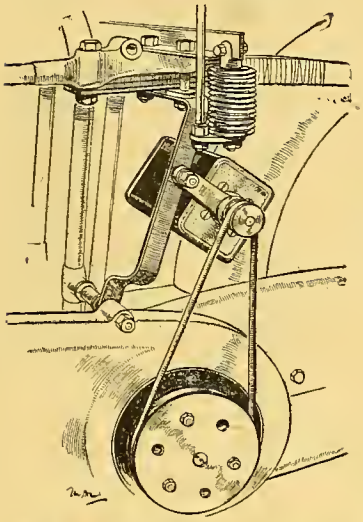


Twin head lamps, with a generator attached to each exhaust pipe, on A. C. Rhodes's Triumph.

climbing" capabilities. This greatly amused most of the drivers, who "T.T.-ed" up each of these (unofficially) observed sections with much danger of getting more than fifteen minutes ahead of schedule. There was an extraordinarily well camouflaged secret check near Salisbury, but memories of a similar occurrence in this area last year made for general caution. Nevertheless, our own observations proved that



Fallolite lamp and dissolved acetylene cylinder carried on W. P. Brandon's Triumph sidecar

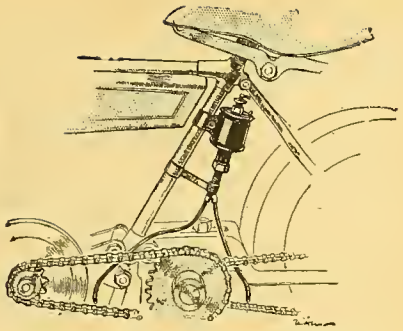


A small lighting dynamo driven by round belt from a pulley on the countershaft of E. Foster's Raleigh.

quite a number unknowingly lost their "golds" at this point.

Only an hour was allowed at the lunch stop, and the travel-stained survivors were despatched on the last lap over the same route as the previous night, but, of course, in the reverse direction. All had to light up before arrival at Staines, and the last twenty miles were rather difficult to follow. There were no enthusiastic spectators grouped on every corner, no urging on by the police force (as further west), and no illuminated arrows.

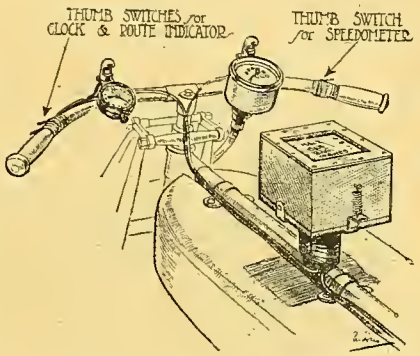
G. Brough (8 Brough Superior), although actually "No. 3," contrived, without imperilling his fifteen minutes ahead allowance, to arrive first, much to the delight of the spectators and the daily



Ordinary gas engine drip feed lubricator and feed pipes to chains on Pike's Levis.

newspaper reporters, some of whom obviously fondled the idea that the event was a race.

Claim cards were signed—these were intended to help the club to eliminate the unsuccessful without unnecessary delving into statistics—number plates returned, and the strenuous 319¼ miles run became a thing of the past. All honour to the finishers!



Method adopted by H. B. Browning (2¾ A.J.S.) to illuminate his route indicator, clock, and speedometer.

A. P. McGowran (4 Triumph sidecar), on the lower part of Salcombe Hill. He made a very good ascent.

# COMPETITORS' IMPRESSIONS.

## To Exeter and Back on an Old Machine.

By W. A. FELL-SMITH.

THERE is a question as old as the "Exeter" itself which an ever-increasing body of motorists ask themselves year by year, and which we again asked in the small hours of Tuesday morning, December 27th, 1921, while battling our way towards Exeter in the teeth of a hurricane.

"Why are we all doing this when we ought to be in bed?"

The answer is to be found at Staines for those fortunates who, having successfully completed their journey to time, experience a feeling of something accomplished in spite of difficulties, intermingled, perhaps, with just a little personal vanity and pride in their machine. The many familiar faces appearing annually in this event are proof of its peculiar fascination, which, once tasted, cannot be denied.

Once more we took a sidecar through the trial, but a hitch at the last moment necessitated a change of mounts, and we had to fall back on an old friend, an 8 h.p. Blackburne, with 14,000 miles to its credit, which started life in the 1919 "Exeter." At such short notice we were unable to make careful preparations, and the glow of the front cylinder during the night reminded us of fireside and home, and caused us to hope that the rumoured severity of Salcombe Hill was exaggerated!

### Chard Hill.

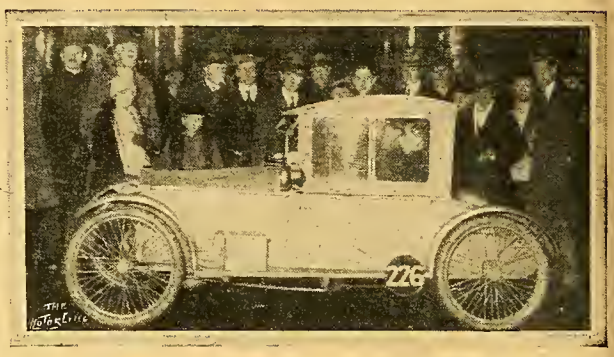
As far as Salisbury all was plain sailing except for a violent head wind, but here the fun started, for torrents of rain fell and beat straight in our faces. Before reaching Chard Hill, however, it had passed off, and we made an easy middle gear ascent in comparative comfort.

Remembering the difficulties of the course between Honiton and Exeter, we now set out to "blind," but trouble with the tail lamp bulb delayed us, and we reached the foot of Peak Hill only six minutes ahead of time. This narrow margin proved none too much, for, to our dismay, the back tyre chose this unfortunate moment to go flat. Finding the valve slightly loose, we blew the tyre up, and it held, and a successful climb brought us to the summit dead on time.

From here to Exeter the road is narrow and winding, and our efforts to put time in hand in case of further trouble were unavailing, but fortunately the tyre still held up.

### The Return.

On returning to the garage after breakfast, however, we found the offending tyre quite flat, and there was nothing for it but to change the wheel after leaving the check, adjustments inside the control being forbidden. This took only four minutes to accomplish, but the tyre on the spare wheel required blowing up, and we finally left Exeter ten minutes behind time. This had to be made up before the Salcombe Hill check, only fifteen miles away; but by dint of driving "all out," we arrived three minutes ahead of time, and rushed the hill with a hot engine, having considerable qualms as to the possibility of success.



Much curiosity was aroused as to how the occupants got inside this Tamplin coupé; the solution is that the upper portion hinges bodily.

An early change down to bottom gear caused our hopes of making a clean ascent to sink, and these completely vanished when we rounded a corner to find crowds of spectators and several hundreds yards of greasy 1 in 6 confronting us, for our back tyre was nearly smooth and three-ribbed! Part of the way up this portion our engine emitted several loud knocks, but slightly retarding the spark did the trick, and away we went, completing the climb with a feeling of mild surprise that it had been accomplished so easily, comparatively speaking, of course.

### Reliable Lighting Arrangements.

The worst was now over, the sun was shining, and up went our spirits again. To describe the rest of the trial would be mere monotony, for nothing of interest occurred. We had to light up again at Hartley Row, but this presented no difficulty with the ever-reliable D.A. to head lamp and dry battery to sidecar and tail lamp system, which we invariably adopt for its simplicity and certainty on competitions.

We checked in at Staines, feeling perfectly fresh; and, having put in our claim for a gold medal, set off for London, feeling at peace with the world and in particular with the M.C.C. for having provided us with such a thoroughly enjoyable outing.

**London-Exeter-London.—**

## On a 4 h.p. Sidecar.

By "DUCDAME."

WHY do we do it? Frankly, I do not really know. But the spirit of adventure must have a lot to do with it. Also, it follows closely on the Show, and when you meet the "boys" there, and the question is asked, "Are you going to Exeter this time?" you say, "Yes," of course. To say "No," without a very good reason, suggests that you are afraid of a little (?) rain—a butterfly rider, in fact—and not to be counted with the real sportsmen. (No man who is not a sportsman goes on more than one "Exeter.")

Immediately you say "Yes," you find out what a lot of friends you have: "Good man, put it there. I am going also. Let's send our entries together."

### No Signs of Rain.

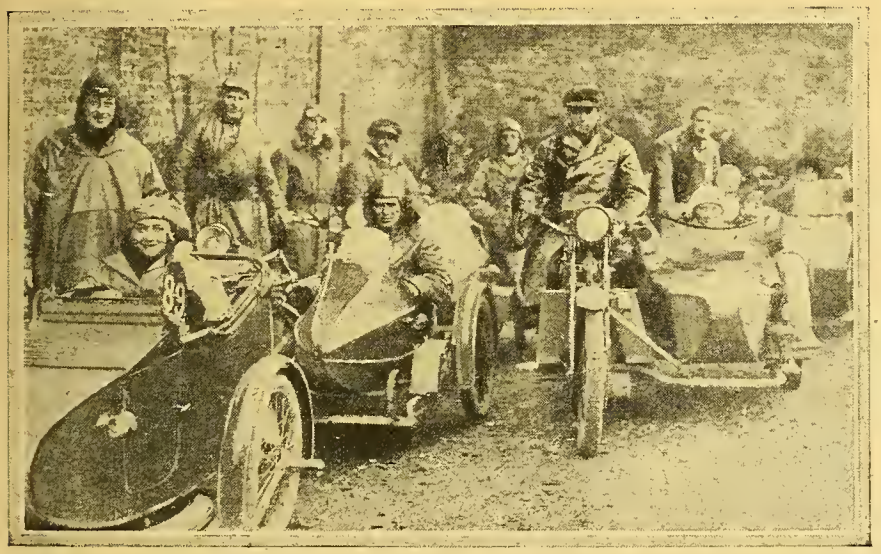
Good wishes simply shower on you while you prepare the machine. Then the usual last minute adjustments, the usual blind up to Staines in the afternoon, and then more reunions, more good wishes, the bustle and crowd and smell of burning oil, and you take your place in the long line leading to the timekeeper and starter, moving up a few yards at a time until it comes to your turn. Then: "Get ready," "Ten seconds," "Go!" and you are off with all the precision of a Brooklands event.

"I think it is going to be nice to-night—no signs of rain," you observe to your passenger, who is studying route card and watch.

Knots of interested people are grouped at corners and outside garages to cheer and shout unintelligible things to you as you pass.

As we get on to higher ground the wind is rising and rain commences to fall, the wind increasing to a raging gale on the port bow as we near the Plain. Luckily our lamps are electric, for one of our neighbours appears to be enjoying the job of lighting his sidecar lamp and tail lamp alternately. Every few miles we see him pulled up by the roadside and striking match after match, then a few minutes later he roars past, to stop again a little further on and repeat the performance. Then that awful wind that blows large pieces of flint about and seems to get under the sidecar as if intent on overturning the outfit. I do not know how the solo riders fared in this. Possibly some of them got on to more sheltered roads before the wind became so strong. But we came across one or two machines obviously suffering from the results of a crash. Second gear on a gradient of about 1 in 25! This is getting serious, but there are others worse off, for we overtake a big twin outfit which is apparently in bottom! Huge hoods and screens may be all right from the passenger's point of view, but ——!

A scene at the White Hart Hotel, Salisbury. J. A. Masters, H. R. Harveyson, C. F. Temple, and J. R. G. Hall, all riding Harley-Davidson sidecars. H. Karslake (Brough Superior sidecar) is seen on the extreme left.



Competitors at the White Hart Hotel, Salisbury, about to resume the journey. The lady passengers looked particularly comfortable, thanks to the efficient weather protection of modern sidecars.

### The Supper Stop.

Salisbury at last, and supper. As we run into the town we notice one of the unfortunates pushing his disabled machine. Hard lines! But it is all in the game. The hot supper improves one's outlook on life wonderfully, and one "buckles on one's armour" (I mean "oilies") to face the weather once more. It is raining in earnest now, and there is a quart or so of water in the sidecar seat. This is soon mopped out, and we are all aboard and off again on the second stage. Now it is the rain's turn, and the deluge of huge drops, hurled into one's face and eyes by the wind, make it well nigh impossible to see. But we carry on somehow, using one eye at a time, to Yeovil, where we pull up for petrol and a cup of coffee "with Mr. Moffat." The petrol consumption is very heavy as a result of the head wind. Then on to Chard. The rain has ceased now, and Chard Hill presents no difficulty. One wonders if this hill ever saves a gold medal. The stars are shining as we sign the check sheet at Honiton, the elements having apparently decided to give up the contest. Peak Hill now has to be tackled. This appeared to be in a looser condition than last year, and a certain amount of wheel spin makes careful driving necessary. Another check sheet to sign, and then on to Exeter well up to time.

Several familiar figures failed to put in an appearance at breakfast, and no riders seemed to know what had happened to them after Salisbury. As we walked (by choice) back to the garage after breakfast, the weather gave promise—

**London-Exeter-London.—**

which was fulfilled later—of being fine, and the return journey proved a joy ride in glorious sunshine. Salcombe Hill was unknown to us, but there was nothing worse than a certain amount of grease, however, and it was climbed mostly on second gear. Lyme Regis looked very pretty with the sun sparkling on the sea. Everyone was on the look out for secret checks now, and, with the exception of occasional stops to keep within schedule time, there were few incidents.

### On to the Finish.

After lunch at Salisbury, more easy going with an eye on the time. (What a nuisance the secret check is!) Near Whitchurch a remark about the time produced no reply from the passenger, and a glance showed that he was sleeping peacefully and looking quite contented! A few miles further on the lights were switched on again, and Staines was reached without mishap a few minutes in front of schedule. After signing the sheet and claim card, we hand in our numbers and receive our "wages" in a neat brown envelope. Glad to be back? Yes! But very glad we went. Another happy memory of excellent organisation, cheerful company, and a "no trouble" run.

I express my personal thanks to the men who stood at corners in vile weather to see that we did not go astray. "A health to you, gentlemen; you deserve a more interesting job."

## A Bijou Sidecar and Limousine Cars.

By NEVILLE HALL.

WELL, it is finished at last, my first London-Exeter! I am glad it rained, because next year, at the finish of the 1922 London-Exeter, I, too, shall say, "Ah, this is nothing; you should have been in last year's run. This has been a picnic."

I suppose it was for many, especially those of the car brigade, but it is not all fun coaxing a 293 c.c. outfit through without even plugs burning out or growing whiskers.

I did not know there were so many telegraph poles in England. We seemed to pass millions, with their glistening wires; it appeared as if they ran from London to Exeter without a break.

The officials were great sports, and did their utmost for all of us. The other competitors, too, were very sporting, and never hesitated to pull to one side to let

About the same age as its driver, B.F.C. Fellowes' De Dion engined machine is well-known at the M.C.C. long-distance runs.

me pass, only they knew not that I was then all out, and had been for some time. I would have given a lot for an extra cylinder once or twice. The hills were not too bad at all—Peak, I think, the worst, but perhaps it was because we took it in the dark. Chard was quite easy, and Salcombe also, although the gradient of the latter was pretty stiff. I confess that I expected plug trouble.

I was very lucky. My back chain slipped off once, and that was my own fault in running it on the slack side. I had no difficulty in keeping up to time, nor in hill-climbing.

We picked up one very nice gauntlet glove, fur covered, which Mr. Bridgman took charge of at the finish. I certainly think the competitors could have been started a couple of hours earlier to enable some of the late comers finishing in daylight, and also I would bar all closed cars. It made me quite bad tempered at breakfast, sitting with my face burning and eyes aching, to see the limousine lads strolling in with posh creases in their trousers and every hair in place. It is not fair to the motor cyclists.

## The Adventures of a 1899 De Dion-engined Machine and its Rider.

By B. F. C. FELLOWES.

THOROUGHNESS is very essential in all things, and especially so to be successful in a long winter trial like the London-Exeter. My machine, when at last ready after overhauling from A to Z, received its usual test by taking a passenger on the carrier, and climbing nicely on top gear two particular pimples near my home. On the level I insist on getting the speedometer needles pointing to quite a respectable figure at which I feel well satisfied.

As the 150 miles run to the starting point is always my surest test that all is O.K., I forsook tuning for a jolly Christmas party, where time went all too quickly, and getting to bed at 2 a.m. resulted in my oversleeping till 9 a.m. on Boxing Day.

I dare not risk the whole journey by road in consequence, so decided to do the first hundred miles by train, and ride from Luton to Staines, and, luckily, I met a fellow competitor on the same train.

We helped each other to get the machines on board (lifting his "'bus" very tenderly, because in all truth it was a very "Superior" one with dazzling plate and enamel).

At the first stop we decided to see if the cycles were still all right, and, on entering the van, were horrified to find

E. M. Chudley, on a 4 h.p. Indian, and E. V Cox with his 5-6 h.p. A.J.S. sidecar, near Charmouth

**London-Exeter-London.—**

them in a ju-jitsu grip on the floor. A murderous glint was in my companion's eyes, and he did not sing carols. Whilst busy getting them upright again, the train moved off, and we finished the next lap in a pitch dark box. However, Luton at last: a brisk run of forty-three miles to Staines, replenishments in plenty for man and machine, and into war paint ready for the fray; 8-9 p.m., and the timekeeper's quiet "Go!" and I was away (with perhaps the most undignified start of any competitor, for mine has not the luxury of a kick-starter).

Up to Salisbury the weather had been fairly kind, but from there onward to Yeovil a severe head wind and drenching rain made the going very hard, and I only kept up the average with difficulty.

The thought of hot coffee at Yeovil acted almost as a magnet, and ere long I was enjoying our host's hospitality. I join with all the competitors when I shower blessings on Moffat, of Yeovil.

Up to Chard Hill the glittering medal was well within my grasp, and I climbed the hill non-stop with ease; but soon after my first and only trouble befell me: the oil pump refused to function, and much valuable time was lost investigating. The trouble was a choked oil pipe, but my endeavours to force the oil through resulted in a bent plunger.

On Peak Hill I met my Waterloo, and decided that a two-speed gear with 10½ to 1 as bottom was not good for Devonshire, particularly with a 2¾ h.p. machine weighing over 2 cwt.

I made Exeter at last, thirty minutes behind schedule time; and, though the coveted gold was now lost, I still determined to try for the lesser honour.

On the return journey, however, I bit the dust yet again at Salcombe Hill.

## ON SALCOMBE HILL. By an Observer.

SALCOMBE Hill, although somewhat more difficult that last year's chief test gradient (Trow), was not so bad in surface as had been anticipated, and its gradient at the worst point could not be steeper than 1 in 6.

To the solo men the hill gave very little trouble; in fact, it would be hard to select anyone as having outshone his fellows. What failures there were would be attributed largely to bad luck, rather than lack of power. The sidecar performances were disappointing in some cases. On the one hand, we had the baby two-strokes making excellent climbs, and on the other 8 h.p. outfits were failing long before the really steep gradient was reached. True, one or two of them had seen quite a few birthdays, while others were suffering from slight over-gearing.

The fastest climbs were undoubtedly made by B. S. Allen, on the rigid frame Matchless outfit, and J. D. Marvin (8 Brough Superior sc.). Which of the two had the honour it would be hard to say, but both rather upset the equanimity of the spectators. E. J. L. Strong (7-9 Harley-Davidson sc.) was also well to the fore on speed, while for good steady climbing the spring frame Matchless was much in evidence. H. W. Glendinning demonstrated very thoroughly that the 4 h.p. Powell is a sidecar mount quite worthy of attention. Giles and Hemy (both on 7 h.p. A.J.S. sidecars) were very sound, Giles, as usual, being rather spectacular. W. H. D. Steer (8 Zenith sc.) found trouble on the corner, his Gradua gear being hardly low enough for the task. W. Hill's rather ancient 8 h.p. Chater-Lea refused the gradient quite early, while G. Kuhn (4 Douglas sc.) went by him in great style. E. J. Pittock (3¾ Scott sc.) also came to a standstill.

## HOW THE COMPETITORS FARED.

Out of the 186 starters in the solo, sidecar, and three-wheeler classes, the following checked in at the finish:

### MOTOR BICYCLES.

A. C. Rhodes (3½ Triumph).
G. E. Cuffe (2½ Metro-Tyler).
G. Brough (8 Brough Superior).
D. H. Davidson (4 Indian Scout).
G. Richardson (2¾ Raleigh).
R. L. Richardson (3½ Alecto).
E. H. Gifford (3½ Martinsyde).
A. A. Symes (3½ Martinsyde).
T. L. Daniels (3½ Douglas).
B. F. C. Fellowes (2¾ De Dion Bouton).
H. F. Fellowes (3½ Norton).
H. W. Deacon (3½ Norton).
R. V. Saltmarsh (4 Harley-Davidson)
A. S. Pinchbeck (3 A.B.C.).
W. Milligan (3½ Sunbeam).
A. Milward (3 A.B.C.).
L. N. Stannah (4 Triumph).
H. C. Nias (4 Triumph).
V. Gayford (3½ Zenith).
F. C. Townshend (3½ Zenith-Bradshaw).
W. D. Pugh (3½ Zeolith-Bradshaw).
W. W. E. Clarke (2¼ Triumph Junior).
E. J. Kehoe (3½ Rudge Multi).
J. J. Boyd-Harvey (3½ Scott Squirrel).
C. Lintott (4½ Humber).
J. A. Hoult (3¾ Scott).
Ivan F. Anderson (2¼ Connaught).
C. C. Lahin (4 Zenith-Bradshaw).
H. R. Hancock (3½ Lea-Francis).
F. R. Cotgrove (3 A.B.C.).
O. P. C. Collier (2¾ Edmund).
W. G. Churchill (2¾ Sirrah).
H. B. Browning (2¾ A.J.S.).
R. C. Staunton (4 Triumph).
B. Gold (2¾ Coulson-B.).
H. Gold (2¾ Francis-Barnett).
H. H. Robinson (2¾ Wooler).
A. G. Wall (2¼ Cedos).
W. J Thomas (3 Ivy).
E. Foster (5-6 Raleigh).
E. M. Chudley (4 Indian Scout).
A. M. Knill (4 Indian Scout).
H. J. Scale (2¾ New Scale).
R. G. Spikins (8 Brough Superior)
William H. Wells (5 N.U.T.).
F. K. Parson (2¼ Ner-a-Car).
R. W. Learned (2¼ Ner-a-Car).
L. Pulham (2¾ Trump-Jap).
F. E. Salter (2¾ Zenith).

### SIDECARS.

P. W. Moffat (8 Douglas).
E. A. Wright (3½ Sunbeam).
E. Atkins (3½ Ariel).
P. W. White (8 Sunbeam).
F. J. Ross (7 Matchless).
R. C. Boxer (7 Matchless).
E. V. Cox (6 A.J.S.).
E. S. Powell (6 A.J.S.).
J. A. Peacock (8 Matchless).
Clifford Wilson (4½ Quadrant).
W. A. Fell-Smith (8 Brough Superior).
S. C. Tait (8 Brough Superior).
H. Clennell (8 Brough Superior).
H. Woollen (6 Martinsyde).
J. T. Bashall (6 Martinsyde).
W. H. Bashall (8 Martinsyde).
D. S. Parsons (8 Matchless).
G. Nott (7 Matchless).
F. W. Stevenson (5 Brough).
E. S. Burnett (4 Triumph).
A. H. Nelson (4 Triumph).
W. F. Guiver (7-9 Matchless).
R. J. Andrews (4¼ B.S.A.).
V. F. Long (8 Excelsior).
William King (7-9 Harley-Davidson).
J. G. Hann (8 New Imperial).
P. Pehrson (4 Dunelt).
C. W. Vallings (4 Dunelt).
R. B. Clark (8 Matchless).
J. A. Hilger (5 Rover).
T. E. Ranger (8 Matchless).
J. A. Masters (7-9 Harley-Davidson).
H. R. Harveyson (7-9 Harley-Davidson).
C. F. Temple (7-9 Harley-Davidson).
H. Karslake (8 Brough Superior).
F. J. Ellis (7 Matchless).
G. D. Hardee (7 Matchless).
C. R. Collier (7 Matchless).
A. H. Ilsley (7 Matchless).
F. Macdonald (8 Matchless).
J. Graham (7 Matchless).
H. L. Misorez (7 Matchless).
F. W. Neill (7-9 Matchless).
Cecil Nott (7 Matchless).
D. D. Tilt (4 Triumph).
A. A Attwood (4½ Quadrant).
W. Reginald Brown (3½ Sunbeam).
G. J. C. Chambers (8 Royal Enfield).
R. Charlesworth (8 Zenith).
Frank Pownall (8 Royal Ruby).
W L. Gard (7 Matchless).
F. W. Giles (7 A.J.S.).
J. G. Biss (4 Norton).
W. C. Hemy (2¾ A.J.S.).
S. S. Debenham (10 Campion).
W. L. Danskin (7-9 Rudge-Whitworth).
F. T. Sibley (7-9 Rudge-Whitworth).
E. J. L. Strong (7-9 Harley-Davidson)
George F. Mason (3½ Connaught).
J. Wallis (7-9 Reading-Standard).
A. C. Ward (4 Triumph).
H. W. Glendinning (4 Powell).
A. S. Guthrie (3 A.B.C.).
J. D. Marvin (8 Brough Superior).
S. Julian (7 A.J.S.).
W. Julian (7-9 Matchless).
N. C. Dear (8 Sunbeam).
J. G. Goodenough (4 Norton).
B. S. Allen (7-9 Matchless).
P. A. Hopkins (3 Ivy).
G. R. Claridge (4 Triumph).
R. H. Attwood (4 Norton).
A. J. Agg (7 A.J.S.).
W. Bucknell (8 Matchless).
A. F. Pulling (8 Royal Enfield).
B. J. Sims (8 Bat).
P. Cunningham (3½ P. and M.).
L. Welch (4¼ B.S.A.).
William Hill (8 Chater-Lea).
A. P. McGowran (4 Triumph).
G. Packman (8 Matchless).
E. J. Pittock (2¾ Scott).
G. Kuhn (4 Douglas).
L. Heller (4 Douglas).
E. J. Hardwick (4 Triumph).
O. S. Bridcutt (4½ Dunelt).
C. G. Pullin (6 Douglas).
Neville Hall (2¾ O.K. Junior).
J. A. Watson-Bourne (8 Brough Superior).

### THREE-WHEELED CYCLE CARS.

W. Joyce (8-10 Grand Prix Morgan).
A. J. Sproston (10 Morgan).
W. H. Elce (8-10 Morgan).
Joseph Richardson (8 Morgan).
H. Beart (8-10 Morgan).
W. E. Line (10 New Hudson).
W. G. Boyer (8 Morgan).
C. E. Bennett (8 Morgan).
F. A. Longman (8-10 L.S.D.).
W. E. Cornwall (9.2 Castle Three).
S. A. McCarthy (8 Morgan).
H. W. Holmes (8 Morgan).
H. E. K. Sawtell (10 Morgan).

### Retirements.

The following retired:

#### MOTOR BICYCLES.

P. Street (3½ Sunbeam).
F. V. Edwards (4¼ B.S.A.).
W. Bray (3½ Sunbeam).
C. J. Wheeler (3¾ Scott).
P. Pike (2¼ Levis).
W. Veasey (3½ Martinsyde).
J. A. W. Armstrong (2½ Metro-Tyler).
P. R. Copland (2¾ Douglas).
G. S Wright (2½ Connaught).
H W. Harrington (2¾ Verus-Jap).
E. H. Fielden (4 Norton).
Martin O'Reilly, 5 N.U.T.).
C. L'Estrange (2¼ Ner-a-Car).
P. L. B. Wills (3½ Rudge Multi).
T. P. Manifold (3 A.B.C.).

#### SIDECARS.

C. W. E. Gaulder (4½ Quadrant).
G. A. Pidgeon (4½ Quadrant).
J. C. Sanford (5 Rover).
C. F. Plowman (3½ Sunbeam).
B. E. Belfield (7-9 American X).
L. Arnold (8 Matchless).
W. P. Brandon (4 Triumph).
S. Farley (10 Ace).
J. R. G. Haill (7-9 Harley-Davidson).
Eli Clark, Jun. (4¾ Beardmore-Precision).
K. Campbell-Cullen (5-6 A.J.S.).
A. F. Scroggs (3½ Sunbeam).
R. Newitt (3½ Douglas).
W. H. D. Steer (8 Zenith).
D I Stone ((2¾ Orbit).
H. H. Saddington (5-6 James).
J. McBirnie (7-9 Indian).
C. N. Green (5-6 Rover).

#### THREE-WHEELED CYCLE CARS.

G. W. Shepherd (8-10 L.S.D.).
F. H. Douglass (10 Morgan).

### Essex M.C.

The annual dinner takes place at 7 p.m. on Saturday next at the Venetian Room, Holborn Restaurant, with Mr. S. G. Cumming in the chair. It will be attended by numerous celebrities in the motor cycle world, and an excellent concert programme has been arranged.

### Worcester and District M.C.C.

Earl Beauchamp (patron of the club) took the chair at the recent annual dinner, being supported by Viscount Deerhurst, Mr. T. W. Badgery (president) and Mrs. Badgery, the Mayor of Worcester (Mr. Samuel Southell), Ald. A. Carlton, and a representative assembly, including several well-known riders and motor cycle manufacturers.

### North-western Centre A.C.U.

The annual general meeting of the centre was held recently at the Albion Hotel, Manchester, and was fairly well attended. The following officials for 1922 were elected: Chairman, Mr. S. W. Phillpott (Liverpool); vice-chairmen, Mr. H. Marsden (Stockport) and Mr. V. Horsman (Liverpool); treasurer, Mr. A. Taylor (Blackpool); auditor, Mr. G. E. Watts (Stalybridge); and delegates to the A.C.U. General Committee, Messrs. V. Horsman, H. Reed, and J. H. Place. Two new clubs were admitted to the centre, viz., Chester and Buxton, making in all twenty-three clubs.

### Stourbridge and District M.C.C.

The club held its annual one-day reliability trial for the "Heroes" Cup on Tuesday, December 27th, starting from the club headquarters at 9 a.m. The morning route included High Oak and Flagstaff Hills, the former being in a bad condition, and only four clean climbs were recorded. A stop and restart test was held on Flagstaff, and a flexibility test on the upper part of Kinver Edge Hill; and from here to the lunch check a short stretch of colonial section was included. After lunch a fifteen-mile circuit was taken, including Hagley Wood, Shut Mill, and Beacon Hills. The following tied with no loss of marks, and the winners were arrived at by means of the flexibility test: W. Worrall (Sunbeam), W. H. Clare (Sunbeam), F. J. Price (Diamond), and J. A. Chadwick (A.J.S.). Results:

HEROES CUP (Best Performance).—W. Worrall (Sunbeam).

COMMITTEE CUP (Best Amateur Performance).—W. H. Clare (Sunbeam).

SPECIAL AWARD (Given by J. Dosher, Esq.).—F. H. Godfrey (Massey-Arran).

SILVER MEDALS.—Class A, F. J. Price (Diamond); Class B, W. Worrall (Sunbeam); Class C, C. Greenwood (Sunbeam sc.).

BRONZE MEDALS.—H. Robinson (Triumph), F. H. Godfrey (Massey-Arran), and T. C. de la Hay (Sunbeam sc.).

SPECIAL AWARD (Loss of no marks and not qualifying for any premier award).—J. A. Chadwick (A.J.S.).

### Bulwell M.C.C.

As the result of a recent meeting of prospective members, a club has been formed as above, Mr. Chas. Marriot, 110, Commercial Road, Bulwell, Notts., acting as secretary *pro tem.* Another meeting of all interested has been called for the 19th inst.

### Doncaster and District M.C.C.

There was a company of nearly fifty at the club's annual dinner at the Red Lion Hotel, the president, Councillor J. Franks, being in the chair. Many valuable trophies, including *The Motor Cycle* Cup, won by H. Le Vack in the open speed trials, were presented during the evening.

### Warrington M.C.

J. Caldwell (10 Morgan) proved the winner of the Ireland Rose Bowl in the club's Christmas holiday trial, held on December 27th. H. Baldwin (4 Norton sc.) and T. L. Hatch (8 Royal Enfield sc.) were second and third respectively. The "single-gear" and "two-stroke" prizes were won by C. Bennett (2¼ Levis).

### Bohemian M.C.C. (Southampton).

A motor cycle club has at last been formed in Southampton, and has been christened as above. It is the outcome of a party of enthusiasts who met occasionally for a jaunt in the New Forest; this was followed by an impromptu hill-climb, and within a fortnight the club was formed, and boasted thirty members. Taking into view the fact that the weather is hardly conducive at this time of year to motoring, the start made is a very promising one. A novel feature is that there are no rules or regulations of any description. A most interesting programme has been arranged. Trade and professional riders are entirely excluded. Intending members are requested to apply for particulars to the hon. secretary, Mr. L. W. Gunnell, 52, Polygon Road, Southampton.

### Dublin and District M.C.C.

The route of the club's holiday trial lay for the most part in the northern portion of Co. Wicklow, and in its ninety-one miles embraced most of the well-known test hills in that district. The entry was rather small, and only nineteen of those who had sent in their names took part in the event. Seven of these were on sidecar machines, but only one of these succeeded in completing the course, as follows:

P. H. Hurse (4¾ B.S.A.), R. H. Hill (2¼ Velocette), J. A. Carville (2¼ B.S.A.), G. A. Daly (4 Triumph), R. Murphy (4 Triumph), Jas. Browne (3½ Douglas), H. Adair (4¼ B.S.A. sc.), J. Healy (4½ James), W. T. Malcolmson (G.N.), R. Humphreys (2¼ Velocette), D. Allen (2¼ Sun), T. J. Slevin (2¼ Velocette), and A. Carton (3½ Norton).

### Cumberland County M.C.C.

Over a hundred sat down at the annual dinner, which was held on Friday evening, December 23rd, 1921, in the Crown and Mitre Hotel, Carlisle, Mr. W. Theodore Carr, M.P., presiding.

### Uxbridge and District L.C. and M.C.C.

Held over a fairly stiff course of about eighty miles, the reliability trial for the Thomas challenge cup had quite a good entry. Results: 1, H. H. Robinson (2¾ Wooler); 2, R. F. Eagle (2¼ Diamond). This club is holding its first annual dinner on Wednesday, January 18th, at 8 p.m., at the Chequers Hotel, Uxbridge. Tickets can be obtained from the hon. sec., Mr. F. F. Hickman, Uxbridge.

### Cork and District M.C.C.

Owing to the state of the roads in the district, the Cork club was compelled to select a circular course for the Boxing Day trial. It embraced a good deal of difficult country, as may be deduced from the fact that the full marks were secured by those who maintained a minimum speed of fifteen miles per hour. The circuit had to be covered three times, and, in addition to a check at the end of each circuit, the lap times were taken at two other points to decide the places of those who made non-stop runs and were on time at the open checks. Twenty-four competitors took part in the trial, and quite a number of new machines were seen in competition, including a four-valve Triumph, ridden by Mulligan.

### Mansfield and District M.C. and L.C.C.

Local riders more than held their own at the speed trials on Boxing Day, the star performance being made by F. Sissons (3½ Norton), who won seven firsts. There were over a hundred entries. Results:

UNDER 300 c.c.—1, J. C. Nichols (2½ J.A.P.), 26⅘s.

UNDER 350 c.c.—1, J. C. Nichols (2½ J.A.P.), 26⅘s.

EXPERTS (Under 350 c.c.).—1, J. H. Simpson (2¾ A.J.S.), 20⅘s.

UNDER 550 c.c.—1, F. Sisson (3½ Norton), 19⅘s.

EXPERTS (Under 550 c.c.).—1, F. Sisson (3½ Norton), 19⅘s.; 2, E. Searle (3½ Sheffield-Henderson).

UNLIMITED TWO-STROKES.—1, F. Nash (Scott), 24s.; 2, J. R. Sylvester (2¼ Velocette).

UNDER 750 c.c.—1, F. Sisson (3½ Norton), 18⅘s.; 2, V. Hancock (3 A.B.C.).

UNDER 750 c.c. (Experts).—1, F. Sisson (3½ Norton), 18⅘s.; 2, F. Hatton (6 Douglas).

UNLIMITED SOLO.—1, F. Sisson (3½ Norton), 18⅘s.; 2, V. Hancock (3 A.B.C.).

UNLIMITED SOLO (Experts).—1, F. Sisson (3½ Norton), 18⅘s.; 2, F. Hatton (6 Douglas).

UNLIMITED SIDECARS.—1, F. Sisson (3½ Norton), 25s.; 2, R. Heelis (7-9 Indian).

350 c.c. SIDECARS (Open).—J. H. Simpson (2¾ A.J.S.), 24⅘s.

550 c.c. SIDECARS (Open).—1, E. Searle (3½ Sheffield-Henderson), 22⅘s.; 2, F. Sisson (3½ Norton).

750 c.c. SIDECARS (Open).—1, F. Hatton (6 Douglas), 22s.; 2, F. Sisson (3½ Norton).

UNLIMITED SIDECARS (Open).—1, F. Hatton (6 Douglas), 22s.; 2, F. Sisson (3½ Norton).

# T.T. DATES.

## Further Opinions on the Advisability of Holding the Races near Whitsuntide.

SINCE we pointed out the unsuitability of the dates fixed for the Tourist Trophy races we have received many letters from riders and manufacturers expressing surprise that the week preceding Whitsuntide should have been chosen—the busiest period of the manufacturer's year. Secondly (although this is not so important), the annual London-Edinburgh holiday event starts on the day following the Senior race, and with this clashing of dates public interest would be divided.

Several of our correspondents have suggested that the M.C.C. classic be postponed, but one cannot ignore the importance of this event, which is and always has been a holiday run, and last year attracted something like 400 entries.

Below we give extracts from further letters received on this important subject, and in the meantime one hopes that the A.C.U. and R.A.C. will be able to arrange more suitable dates by postponing, for a week or so, the car race, which, at present, restricts the choice of dates for the motor cycle event.

All motor cyclists desire to see the 1922 T.T. races an unqualified success. By dint of hard work and careful organisation the Auto-Cycle Union has created an event regarded by the whole world as a classic race, and any circumstance likely to restrict further progress or minimise its importance is to be deplored. What every sportsman wishes to see is a fully representative entry list for the blue riband event.

The views of MR. D. S. ALEXANDER—a well-known T.T. competitor, who is also an agent—follow:

"I have noted very carefully all you say with regard to the Junior and Senior T.T. races being held on May 30th and June 1st, and I should have been only too pleased had they been held earlier, but I am quite satisfied with the dates already set upon. In 1914 the T.T. race was held in May, and I think that for most agents and motor cycle dealers of Britain the earlier it is held the better, and to corroborate my statement, one of the best financial years for both agents and manufacturers was 1914.

"With regard to Scotland, at any rate, the Whitsuntide holiday does not affect ourselves, and at times such as the Whitsuntide holidays ought not to interfere with business.

"With regard to the second clause of your letter, the date of the London-Edinburgh run could easily be altered by the A.C.U.* to meet such an important event as the T.T. race.

"Undoubtedly, from the points of view of manufacturers, agents, and prospective purchasers of motor cycles, the T.T. race is our finest advertisement, and the earlier it takes place the better it is for the agents, as very often prospective purchasers hold over their orders until such time as the official intimation of the result of such races or events as the T.T. race is given out. Talking personally as an agent in Scotland, I find that this great trial is responsible for a great amount of business, and would prefer greatly that it took place in the earlier part of the year."

[*The London-Edinburgh run being a closed event organised by the Motor Cycling Club, the A.C.U. has no jurisdiction in the matter.—ED.]

MR. HUGH MASON, a T.T. winner and manufacturer of N.U.T. motor cycles, writes:

"The writer agrees with you that from a manufacturer's point of view the time is unsuitable, as the week before the Whitsuntide holidays is usually one of the busiest in the season. He is also of the opinion that it is a great mistake that this should clash with the date of a classic event such as the London-Edinburgh."

THE HOBART CYCLE CO., LTD., state:

"Our opinion is that the T.T. races should take place between Whitsuntide and August."

MR. FRED W. DIXON, who put up such a splendid race last year and was runner up, is another who deplores the dates chosen. He writes:

"To give these races the publicity they deserve I certainly consider it unwise to choose a date which clashes with an event such as the London-Edinburgh.

"For my part, I am most concerned about the weather conditions, both for early morning practice and the actual races. If there is any danger of this earlier date, viz., June 1st, giving us any less favourable weather than we have been favoured with in the past, I should strongly favour holding the T.T. later in the season, and chance the condition of the roads after the car race."

# "THE MOTOR CYCLE" FILM.

FOR three days just before Christmas *The Motor Cycle* film was shown, for the first time in Scotland, at the Cinema House, Renfield Street, Glasgow, on behalf of the Western M.C.C. Mr. J. Robinson, the secretary of the club, now writes:

"*The Motor Cycle* film arrived as per schedule, and was duly exhibited on the 15th, 16th, and 17th ult. The exhibition has proved a great attraction to motor cyclists, not only of Glasgow, but also from outlying districts, who have been glad to avail themselves of an opportunity of becoming acquainted, through the film, with the methods of and with the territory over which these events of first-rate importance were run. The only criticism which I have heard is that there is not sufficient of it, especially the T.T. races. I have to thank you on behalf of the club for the thorough manner in which you have carried through your part of the arrangements, and hope that other clubs will find the exhibition as interesting as we have."

On Friday and Saturday of the same week the York and District M.C. showed the film—on Friday at a private exhibition to club members, and on Saturday at the Grand Picture House, Clarence Street, York. Mr. E. Wasling, the hon. secretary, says:

". . . the members present were highly pleased with the picture . . . everything went off very satisfactorily . . . the film was greatly appreciated."

On Wednesday of last week the Yeovil and District M.C.C. exhibited the film in Yeovil. Mr. C. G. Clapshaw, the hon. secretary of the club, writes:

". . . The film was much appreciated by the audience, including a large number of non-motor cyclists. The Picture Palace was packed, and a few had to stand. I am sure that the film will be the means of gaining one or two more members for the club; in fact, I had two enquiries from prospective members at the show."

Mr. John Howell, hon. secretary of the Worcester and District M.C.C., writes:

"It was shown at the Silver Cinema, Worcester, with huge success, aud the only thing about it is that there is not enough of it. There is no doubt that this film has made history in the motoring world, and it is an effort on which you are to be congratulated."

On Monday next it will be shown at Dewsbury on behalf of the local M.C.C., and on Wednesday at Clitheroe.

# A SUPER-SPORTING TRIAL.

## An Arduous Day at Christmas-time for Birmingham M.C.C. Members.

MEMBERS of the Birmingham M.C.C. recently asked for a super trial with a few stunt sections in it. They certainly had their desires satisfied in the half-day trial held on December 27th.

There were included a colonial section: no fewer than four splashes; five special tests, including a slow climb, brake test, acceleration test, and two grass tracks; and five test hills close upon each other, including the Beacon, Romsley, and Fordrough.

The last event of the year for the Birmingham Club, the trial attracted no fewer than forty-one entries. A circular route of about sixty miles started from the Sanatorium, Yardley Road. Here the competitors were supplied with refreshments by Mrs. Riley, whose kindness was greatly appreciated.

### Early Difficulties.

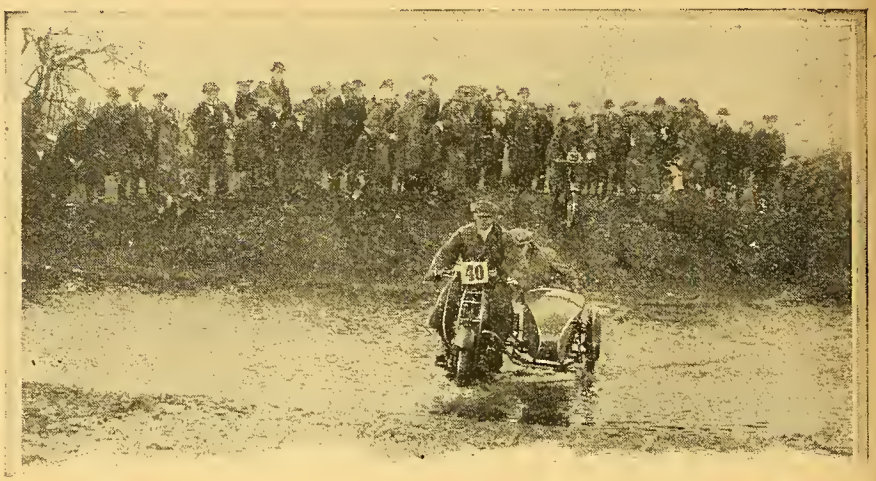
The first man left at 11.1 a.m., proceeding to the colonial section at Bacon's End, near Coleshill; and, judging by the grease, "Bacon's End" is a very appropriate name.

There were ten failures here, as the "roads" were in a very muddy condition, and wheel grip was a matter of luck.

Competitors now returned to the starting point, where a time check was held, many checking in late.

Next followed the splash section. At the first obstacle the approach was bad, as the riders had to slide down a greasy bank before taking to the water. The crossing itself was easy, but five failures were recorded. The other three fords were more formidable, and a greater number failed to negotiate them.

Prior to this, some excitement was caused by F. Hallam tackling the first splash in the wrong position, which resulted in his machine being submerged over the hubs. Several of the spectators had to come to his aid to haul the machine up the bank.



Even though the ford at Yardley was obviously destined not to baulk competitors, many spectators gathered to watch the fun. A. Watson (Sunbeam), followed by C. I. Francis (Francis-Barnett).

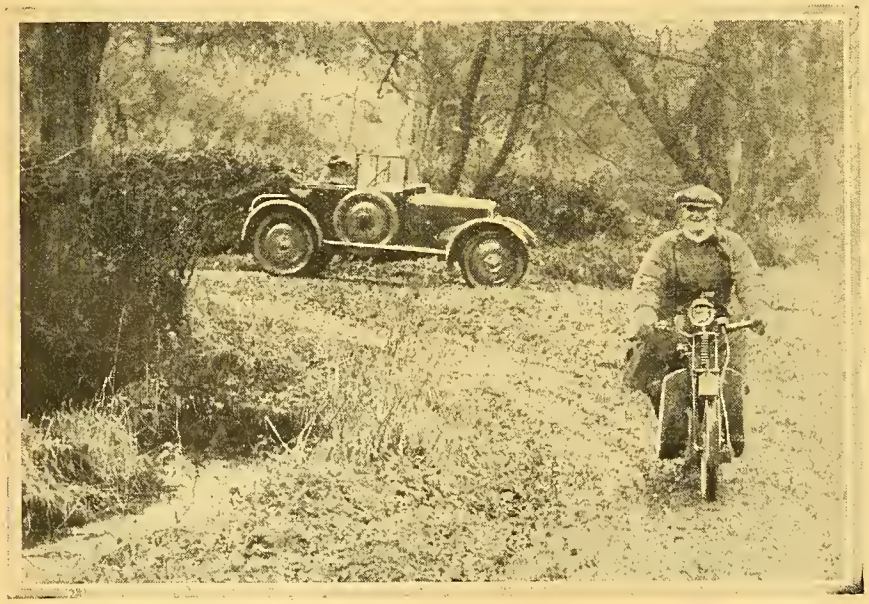
The stop and start test accounted for eight failures, and the brake test for three; but the various hills were surmounted with very little difficulty.

In the slow climb Bert Kershaw put up an excellent performance, but was penalised for putting his foot to the ground. H. C. Jennens also made a very good show. In the sidecar class D. Jenkins made an outstanding climb.

G. Butcher charged the bank on Romsley Hill, and came to a standstill.

One of the competitors entered with the idea that trials were useless, as such things as splashes and hills could be negotiated by anyone with ease. Unfortunately, he failed in the various tests, and eventually retired.

Out of the forty-one who started, only twenty-four checked in at the finish, and of these there were about three who were on time.



Rev. J. M. Philpott (2¼ Velocette) on the leaf-strewn track near Romsley.

---

### THE 1922 TOUR DE FRANCE.

THE Moto Cycle Club of France is organising the Tour de France from March 25th to April 9th, and a copy of the rules and regulations reveals some interesting facts concerning the trial. The journey starts from Paris, and consists of a tour round the whole of France. Every third day or so an exhibition of the competing machines is to be held; for example, the first three days carry the competitors from Paris to Bordeaux, when there is a day of rest for the purpose of exhibiting the machines. The next three days machines pass through Toulouse, Avignon, to Nice, where an exhibition will be held. Thence the route leads from Nice to Grenoble, then to Besançon, and from Besançon to Strasbourg, where another exhibition will be held. The next two days will be spent in travelling from Strasbourg to Lille, *via* Nancy and Rheims, followed by an exhibition at Lille, while the final stage will be from Lille to Paris.

Some interesting country will be traversed, and the length of the trial, some 2,700 miles, will impose severe tests upon the machines, as it is reasonable to suppose that all the roads will not be of billiard-table smoothness. In the southern part of the run, the foot hills of the Pyrenees and the Maritime Alps will be crossed; while after these a considerable portion of Alpine country will be crossed. Other mountain ranges which the competitors will have to cross will be the Jura and the Vosges.

As the trial is of an international character, it will be held under the F.I.C.M. rules, and competing machines will have to conform to these conditions.

Number plates to be illuminated thirty minutes earlier, *vide* Road Vehicles Registration and Licensing Order (1921).

### To All Readers.

A Happy New Year!

### Praise for Police.

We have had several letters from London-Exeter competitors appreciating the services of helpers and police, who, through the long, wet, and windy night directed the riders on their muddy way to Exeter.

### Steel Tubing.

A most interesting paper was read before the Institution of Automobile Engineers on Tuesday last. Mr. W. W. Hackett, who is connected with one of the best known steel tube concerns in the world, described some tests, the results of which are of extreme value to motor cycle manufacturers. He pointed out the suitability of high carbon steel tubes for motor cycle construction and the importance of correct lug design.

It was clearly demonstrated that in many cases fracture cannot be prevented by increasing gauge, but may be cured by tapering the tube or gauge. The whole paper led to the conclusion that motor cycle frames can with advantage be made lighter than at present.

### New Motor Knights.

The New Year's list of honours includes Mr. Alfred Samuel Mays-Smith, president of the Society of Motor Manufacturers and Traders, who is granted a knighthood; and Mr. William Malesbury Letts, managing director of Crossley Motors, Ltd., to be a Knight of the Order of the British Empire.

### Licences.

Renewals of licences for motor cycles are now necessary, and should be obtained from the office from which they were issued last year, or from a main post office. The annual licences cost: For lightweights under 200 lb. 30s., or with sidecar 50s.; over 200 lb. 60s., or with sidecar 80s.; three-wheelers 80s. Quarterly licences are now issued at the following rates: Motor bicycles under 200 lb. 10s., with sidecar 15s.; over 200 lb. 20s., with sidecar 25s.; three-wheelers 25s.

### Motor Cycle Club for Great Yarmouth.

Referring to the recent paragraph in these columns suggesting a motor cycle club for Great Yarmouth, Mr. R. A. Lower, hon. general secretary of the Norfolk M.C. and L.C.C., points out that this club was originally called the Yarmouth and District M.C.C., and that at present it has a number of members belonging to the latter town. The speed trials referred to were actually run by the Norfolk Club, and Mr. Lower suggests that Yarmouth motor cyclists who wish to join a live club should become members of his organisation.

AT THE SUMMIT OF KOP.

Beneath the setting of the crescent moon, the competitors thundering up the gradient, and the long procession of lights in the valley beyond Princes Risborough was an impressive sight to the watchers at the hill-top in the annual London-Gloucester Trial.

## Special Features.

1921 IN RETROSPECT.
THE LONDON-EXETER-LONDON RUN.
NON STOP HILL CLIMBING IN THE DARK.

### Observed Hills at Night.

Peak Hill in the London-Exeter trial and Kop Hill in the London-Gloucester will do much to harden trials riders to observed hills in the darkness. In the latter trial the hill was actually in a non-stop section, and, although easy, accounted for many failures. We await with trembling the inclusion of a really freak hill to be climbed after dark. What about Park Rash or Alt-y-Bady at 11 p.m.?

### A.C.U. Stock Machine Trial.

Preliminary arrangements for the second trial of standard stock machines, to be held on Wednesday, March 15th, are being made by the A.C.U., and, although the complete regulations are not yet available, many prominent manufacturers have expressed their desire to enter motor cycles or cycle cars. For this trial machines are selected at random by A.C.U. representatives from the stocks at the makers' works or at the premises of their agents, and no special preliminary preparation of them for the contest is allowed. It will thus be readily appreciated that machines which score successes in the event are really identical with those which the public can buy, and the trial, therefore, is of great practical value.

### The Motor Cycle in America.

The marketing of motor cycles in the United States of America is exercising the minds of sales and financial experts at the present time. The following statement appears in *Automotive Industries* as being from within the motor cycle industry: "We strive to reach a field of dignified clean cut riders. To do so we educate them in terms of exalted speed and dare-devil exploits of track burners. We bemoan the presence of public disfavour, and to remove it we increase the burden by eternally shouting speed, speed, and more speed."

In Great Britain the motor cycle has taken its place in all spheres of utility, and speed is not the chief factor.

### New Rule of the Footpath.

Citizens generally will welcome the announcement that the Bristol Watch Committee has definitely abandoned the bad old rule, so far as pedestrians are concerned, and requests the public to keep to the left of the pavement, commencing from New Year's Day. It is obvious that, if people walk on the left-hand side of the pavement, they will face vehicular traffic in the adjacent part of the road, and that in consequence fewer accidents will be caused when they step into the roadway than is the case at the present time, when silent and swift motor vehicles overtake from behind. The idea of inaugurating the new rule of the road on New Year's Day was happy and appropriate.

# NON-STOP HILL-CLIMBING IN THE DARK.

## Sporting Open Twelve Hours Trial to Gloucester of the N.W. London M.C.C.

## Mishaps and Failures in the Darkness.

AMONG the winter competitions the London - Gloucester - London open trial ranks next in importance to the M.C.C. London-Exeter run. This year the N.W.L. M.C.C. was forced to change the starting point, and chose the western entrance to the Hendon Aerodrome—quite an excellent place—though rather out of the way. Following on a rainy and windy day, to say nothing of a wild night, Saturday morning broke fine and chilly. The remnant of the storm had veered towards the North, and was still blowing strongly, but was rapidly drying the rain-sodden roads.

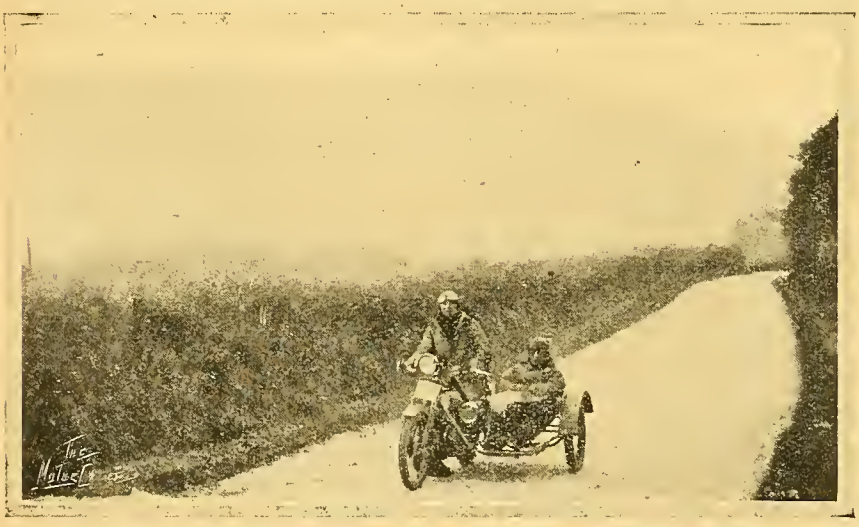
### Some of the Competitors.

A glance round the competing machines revealed some interesting details. B. J. Pooley, riding a Velocette, is the fourteen year old son of the organising secretary of the club, and such a ride as this is no small effort for a schoolboy. J. A. Newman was riding the Douglas he used in the International Six Days Trial. F. W. Stevenson (5 Brough sc.) carried his dynamo behind the magneto of his flat twin engine, driving it by means of an enclosed chain—a very neat arrangement. Several new models made their first appearance in open competition on this the last day of the old year. F. D. Winslow and J. W. Troughton both rode samples of the new X.L., C. C. Labin and S. E. Longman rode new Zenith-Bradshaws, B. N. Taylor was on a Hagg tandem, and his companion, R. N. Thomas, also drove one of these machines with a passenger on the back seat. C. W. Lewis drove a new 4¼ h.p. Beardmore-Precision.

There were several lady drivers: Mrs. Janson, of Ner-a-car fame, whose machine ran very well; Mrs. Hardee, so well known to our readers; and Miss Padgett, who piloted one of the T.B. cycle cars.

A group of competitors near Birdlip on the outward journey—H. Le Vack (7-9 Indian sidecar), J. W. Troughton (4¼ X.L.), and Miss H. Padgett (8 T.B. cycle car).

Once the rough roads of Hendon were left behind, the going was quite good. C. W. Bairstow (Indian sc.) was early in trouble, and stopped to make an adjustment at the top of Stanmore Hill, and pulled up again in Watford High Street. Beyond the latter town we noticed Harding (Triumph) making up lost time. Near Boxmoor Howe's Martinsyde, which had been running faultlessly, developed slight misfiring, which gradually became worse. Carburetter trouble was suspected, and some time was spent investigating matters, which resulted in his being late at the check outside Tring.



A flat twin on Birdlip during the return journey—F. W. Stevenson (5 Brough sidecar).

### The Morning Non-Stop.

Here a turn to the left was taken, and the interesting and tricky morning non-stop section was entered. Soon Waterworks Hill was reached, the surface, like that of others in this section, being moist and rough. It was somewhat steep, possessed an awkward corner, and accounted for more than one failure, as it proved the undoing of H. J. Curtis (Triumph), who was seen looking disconsolately at his mount—magneto trouble was said to be the cause of his failure—L. L. Newman (Duzmo), and Phillips (Norton). The non-stop section introduced the riders to several hills which occurred in the course used last year by the M.C.C. in the team trial for *The Motor Cycle* Cup; but they were reached by devious ways, and often came as a surprise even to those who knew the route to which we have referred. There were several cases of sparking plug trouble over the hilly section. Two of these were Winslow (on the X.L.) and Neville Hall (O.K. sc.), who was driving

**Non-stop Hill-climbing in the Dark.—**

the same miniature sidecar outfit he used in the Exeter run.

After passing the main entrance to Chequers—the Prime Minister's residence—an acute bend was taken to the right, which was exceedingly rough and awkward to negotiate. Whyteleaf Hill accounted for several failures, and proved to be the undoing of Pooley (Velocette). Here Howe's Martinsyde, which had been persistently firing on one cylinder since the beginning of the section, made a splendid climb, only to fail miserably on Kingston Blount, the last hill in the section. The trouble was discovered at this point to be caused by too long a high-tension wire, the insulation of which had been burnt through in three places. After Whyteleaf came the descent of Kop, followed by the negotiation of Princes Risboro' village, where, owing to a petrol lorry driver failing to signal he was about to make a turn, a regular *mêlée* occurred, in which Le Vack and Davidson (driving Indian sidecar outfits) and Howe (Martinsyde) were involved. Happily, all extricated themselves without accidents.

### Clear of Checks Again.

Next ensued a piece of easy country through Chinnor and the final piece of the section, the ascent of Kingston Blount leading to the top of Aston Rowant, halfway down which the check was situated marking the termination of the non-stop section. From the Lambert Arms on to Oxford the roads were excellent and dry.

R. P. Purnell's tiny J.E.S. was too highly geared, and failed on several of the hills. Bourne (New Imperial) was reported to have had trouble with a slipped timing wheel, Crabb (Cleveland) to have had plug trouble in Cirencester, and Stone (Orbit sc.) to have experienced a twisted frame. The luncheon arrangements were excellent, and the same may be said of the organisation throughout the trial.

### The Homeward Journey

After lunch Birdlip had to be negotiated, and though this is a long and trying climb of over a mile, and with a maximum gradient of just under 1 in 6, the wind was behind the competitors, the surface was excellent, and there were few failures. With the keen north-west wind at the back of the competitors, the return journey was more comfortable than the outward trip, even though the temperature had fallen considerably.

The weather during the night portion of the trip was as fine as it had been during the day, but one or two incidents marred the return journey. C. Chawner (Coulson) was dazzled by the head lights of an oncoming car and was thrown, breaking his leg. The night non-stop section covered the same district as that traversed in the morning, but somewhat shorter. Here, J. T. A. Temple (3½ Norton) left the road and collided with a competing car on regaining it. Gwynn (Grigg) missed his way, and lost his non-stop here.

### Hill-climbing in the Dark.

It was approximately 6.45 p.m. when the watchers on Kop Hill, in the homeward non-stop section, saw the gleaming head lamps of the competitors creeping along the road in the valley below. In accordance with the meteorological forecasts, visibility was good, and a crescent moon was setting according to programme.

The sinuous nature of the non-stop section made schedule riding difficult, especially for the solo men.

Well on time the two 6 h.p. Martinsyde sidecars, driven by G. Baxter and R. Hart, came up the hill together, closely followed by S. R. Axford (8 Brough Superior sc.).

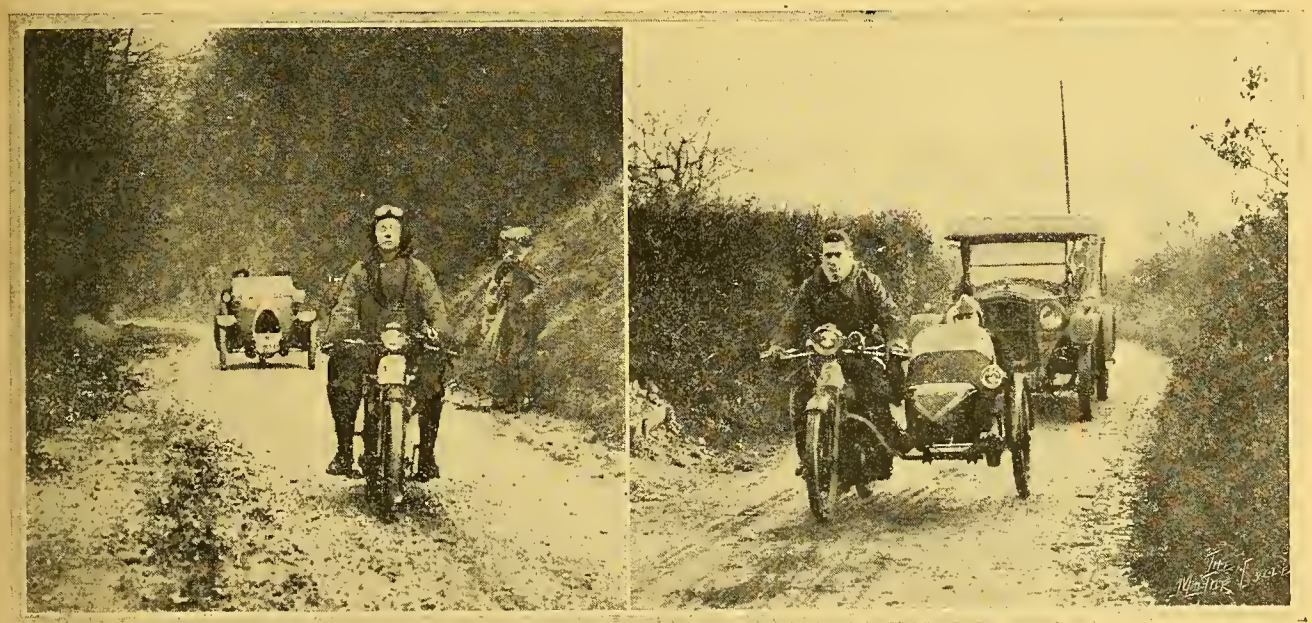
Although Kop Hill is not very severe, its rather loose surface and the darkness combined to make things difficult, and several failed. Excellent climbs were made by N. V. Young (4¼ Sunbeam sc.), L. Welch (4¼ B.S.A. sc.), J. W. Troughton (4¼ X.L.), N. Hall (2¾ O.K. sc.), L. Nicholson (2¾ Omega), Mrs. G. M. Janson (2¼ Ner-a-car), Mr. H. Hardee (8 Matchless), G. W. Shepherd (8 L.S.D.), S. A. McCarthy (8 Morgan), H. W. Holmes (10 Morgan), and Le Vack and D. H. Davidson (7-9 Indian scs.). D. J. Stone (2¾ Orbit sc.) was late, but climbed well.

Most of the solo riders had no difficulty, and in many cases it was impossible to see their numbers, so that several good ascents go unrecorded.

Of the unfortunates, R. A. Bull (8 Matchless sc.) was late and failed unaccountably; J. C. Lowe (4¼ James sc.), W. G. Crabb (2¾ Cleveland), and Miss Padgett (8 T.B.) all needed help. F. G. Morgan's (2¾ Cotton) belt broke when he was going well, and his team mate, W. Brooke, was all over the road with legs trailing, as though he had a flat tyre. W. R. Gray (2¾ Coventry Eagle) stopped near the top observer, thinking he had reached the check, and had difficulty in restarting. V. Gayford (3½ Norton sc.), and J. A. Peacock (8 Matchless sc.) both climbed, but with their passenger on the carriers—surely unnecessary.

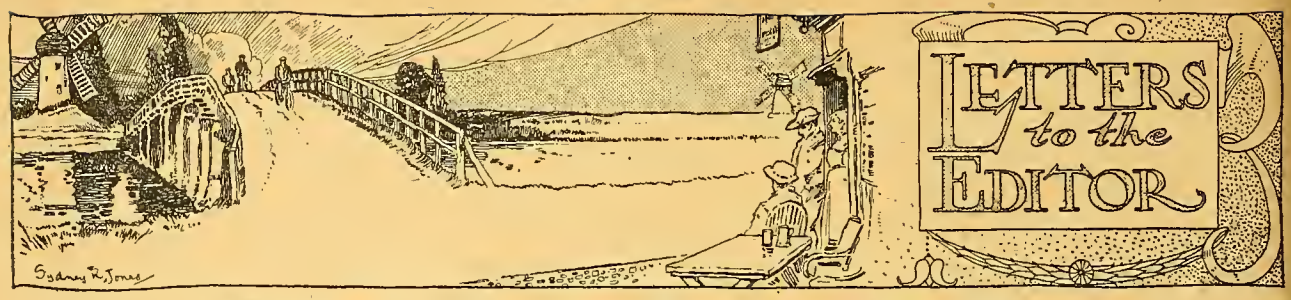
### Lighting Equipment

On the hill the lighting equipment on the majority of the machines functioned well, but C. C. Labin (3½ Zenith-Bradshaw) came up with no lights at all, and stopped ultimately. G. E. Cuffe's (2½ Metro-Tyler) Fallolite head lamp only emitted a dull blue glimmer like a glow worm in a bottle, while E. W. Howard (3½ N.U.T.), despite two head lamps, only had a spot of light about one length ahead. Electric lighting was used on most of the sidecars. Arrowing throughout the non-stop section was good, but the route was tricky. After the descent to the Whyteleaf check, where many were late, easy roads were followed to the finish, where approximately seventy checked in.



COMPETITORS ON THE MORNING NON-STOP SECTION.

C. Barham, on a 2¾ h.p. Warnes, with Barr and Stroud engine. C. L. Sprosen (3½ Connaught sidecar) climbing Dunsmore Hill



The Editor does not hold himself responsible for the opinions of his correspondents.

**All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.**

### *TWO-STROKE FAILINGS.*

Sir,—Perhaps the "Satisfied Rider" of your issue of December 15th may like to know that I, too, possess a Sun-Vitesse (269 c.c.) that *does* burn its top piston ring.

Slough. E.D.

### *WHICH IS THE MOST ECONOMICAL DUAL-PURPOSE MACHINE?*

Sir,—If you will allow me, I should like to start a discussion on the "most economical dual-purpose motor cycle."

The machine in question should be preferably a 4 h.p. single-cylinder, though other types are not excluded. Economy should include *all* expenses which are ordinarily incurred by the average motor cyclist.

I have no opinion on the subject, but should be interested to know some views of other motor cyclists.

J. C. BARLOW.

### *TYRE FITTING AIDS.*

Sir,—Please allow me to endorse "Ixion's" remarks *re* the Ewart tyre fixer; it is absolutely "the goods."

I am employed in a large garage as vulcaniser and tyre fitter, and we recently had the aforementioned gadget installed, and since then it has been quite a pleasure fitting tyres. A few days ago, with its assistance, I was able to remove a cover and tube off a Sunbeam wheel, fit a new Michelin Cablé cover and tube (820×120 mm.), and pump up to the required pressure in twelve minutes, so that speaks for itself. HF 3807.

Nottingham.

### *OBSTINATE VALVE CAPS.*

Sir,—I notice in "Occasional Comments" "Ixion" is in search of an anti-binding compound. I can recommend that used by all steam turbine builders, namely, graphite and boiled oil. This is applied to the bolts, subjected to the heat of superheated steam, and I can vouch for it being "the goods." It can be bought ready mixed in tins from any engineers' stores. S. HENDERSON.

Sir,—I note in your valuable journal that "Ixion" is in trouble with immovable valve caps.

I find the best and most sure way of removing these obstinate parts is to dope them well with turpentine, then obtain about 4ft. of large diameter gas pipe, and slip the end of the spanner into one end of the pipe. Now heave as much weight as possible on the other end of the pipe, and I guarantee something will go—either the valve cap will give in, or he will tear the engine clean out of the frame.

C. H. WAINWRIGHT.

### *T.T. OR LONDON-EDINBURGH.*

Sir,—If the T.T. clashes with the London-Edinburgh, drop the London-Edinburgh, an event only retained for sentimental reasons, and serving no useful purpose, either for the improvement or demonstration of the modern motor cycle. When a baby two-stroke takes a sidecar up Porlock and Lynton (to say nothing of the Scottish Six Days hills). the presentation of a gold medal to the driver of any mechanically-propelled vehicle for a run to Edinburgh in the summer is farcical in the extreme. Members of the Motor Cycling Club can well take their club runs in smaller bodies, and the trade confine their entries to the really severe competitions. What about the rights of other road users? Just fancy meeting a fifty-mile string of competitors on a dusty road. Send these gold medal hunters to the Welsh mountains and limit the entries. A. V. SMITH.

### *MOTOR CYCLISTS IN DREAMS.*

Sir,—"A Motor Cyclist in Dreams" will no doubt find Miss or Mrs. Maude Stansfeld's advice rather tedious to follow, but I can assure him that if he will turn his money and carefully say "Hey presto, abracadabra!" three times every time he hears the clock strike thirteen, he will find this equally effective. EDWARD DUNNE.

### *SUPERLATIVE ELEVATIONS.*

Sir,—Having due regard for the claims of your Aberdeen correspondents on this matter, I should like to point out where there is a road in Perthshire that takes some beating as a claimant for the title of "Highest Road in Scotland." This is not a public road, but leads to the shooting lodge of Felar on the Duke of Atholl's estate, and branches off the Pitlochry-Kirkmichael road at a point near the village of Straloch. It rises to a height of about 2,300 feet, which is 100 feet higher than the Cairnwell, and is kept in perfect condition. I have been over this road and the Cairnwell many times, both with car and motor cycle, and have also made acquaintance with Kenmore and Amulree hills, but I consider any of those mere child's play compared with the Straloch-Felar road. T. ROBERTSON.

### *POSITIVE PRESSURE LUBRICATION PUMPS.*

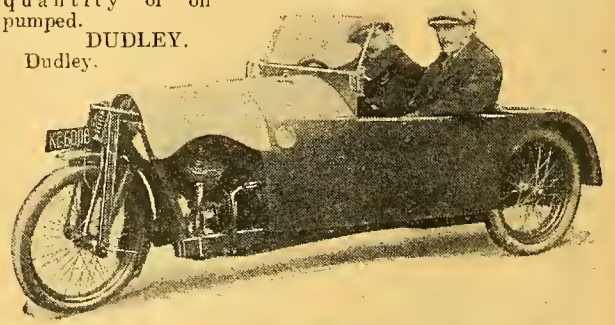
Sir,—As a motor cyclist who is a believer in automatic lubrication of motor cycle engines, I have read with interest Mr. Cochrane's reply to your criticism of the Showell rotary pump. I cannot understand how pressure can be produced by an arrangement of this description; and, for lubrication to be reliable, pressure is essential.

Another point which does not quite inspire confidence in my mind is that the oil is controlled by a needle valve, which means a restricted passage. In cold weather this must be far from reliable, owing to the congealing of the oil and necessitating, as it would, continual adjustment. Past experience of others, as well as myself, with a well-known type of spring-loaded pump with a drip feed has demonstrated that it is not reliable in cold weather, and that frequent adjustments have to be made.

To my mind, for satisfactory lubrication, a positive pressure is essential, and must be fitted with a device for varying the quantity of oil pumped.

DUDLEY.

Dudley.



The Gillies Comcar, a three-wheeler with front wheel steering and engine in front of the chassis. The drive is by propeller shaft through bevel gears on the back axle, a three-speed and reverse gear being fitted. The machine, which is made by Gillies Brothers, Bexley, Kent, is equipped with windscreen and hood, and has wheel steering, a dry plate clutch and a kick-starter.

### ELIMINATING VALVE CLATTER.

Sir,—In the issue of December 15th "Multi" suggests a method of silencing Rudge valves.

I quite agree with "Multi" that the clatter does not come from the overhead gear, but from the timing wheels, but hardly think that blocking up the holes between the timing case and crank case is practicable without providing some other crank case compression release.

I should be interested to know how "Multi's" engine behaves, and whether he has noticed any "oil slinging."

Pimlico, S.W.1. RULTI.

Sir,—We have noted with great interest the various "gadgets" suggested to allay the noise emanating from the Rudge overhead inlet valve gear.

But surely the most efficient device, and certainly the most mechanical, has not been mentioned, viz., the makers' own eccentric rocker adjuster.

In our experience, if this is set to give no clearance when hot (it can be adjusted from the saddle), the Rudge engine is no more noisy than the average highly efficient unit.

Certainly the overlap cam in the racing machine sometimes causes a pronounced "ring," but, of course, speed settings, with their quick valve lifts and drop, must always provoke more noise than standard, more especially with valves of the diameter used in the Rudge engine.

The perfect quietness of the Multi gear and belt drive, and the efficient silencing arrangements, both serve to accentuate any engine noise, which perhaps would not be apparent with a chain drive or gear box.

Even with a Rudge, which has not received the attention it deserves, one can pardon slight noise whilst experiencing the delightful sensation of 40 m.p.h. with the engine just ticking over on a 3½ to 1 gear. CLEARE AND CO.

Woolwich, S.E.18.

### TWO-SEATED SIDECARS IN TRAFFIC.

Sir,—At the risk of a crushing reply, may I, as a consistent and experienced roadman, raise a point overlooked in your comprehensive Show report and criticism numbers?

Be the driver ever so careful, a heavy sidecar outfit, even after long acquaintance, lends itself to miscalculation when subjected to close clearances in traffic, etc. From three personal experiences, I have learnt to give the man "cutting in" ample room, despite personal precedent claim to right of way. Only in the first case could I reasonably decry reckless driving. As a mere cyclist, these encounters have been greatly to the detriment of my front wheel, and it is therefore with considerable trepidation that I, for one, view the advent of vehicles of the taxi-sidecar and O.E.C. production class. From a study of some of these monsters, it would seem that the driver must lose sight of the overtaken well before the rear of the latter is parallel with the front of the former. Thereafter the position and safety of the near side vehicle is a matter of mere conjecture.

I shall no doubt be informed that the minimum clearance being known, trouble is avoidable. Military experience of visual measurement even is a sufficient answer. In any case, the liability, under normal circumstances, rests with the overtaker until the rear of his vehicle is clear of a parallel line based on the front wheel of the overtaken.

F. C. PEACOCK.

### GERMANY—AS SEEN BY A BRITISH MOTOR CYCLIST

Sir,—As a reader of your paper from 1903 up to the present time, I am sending you a few notes on the pastime from the point of view of a Britisher who is living abroad.

Conditions as regards motor cycling out here are very different from those at home. Until quite recently, petrol and oil were almost unobtainable, except in the larger towns, and there the supply was uncertain, consequently long journeys entailed the carrying of supplies with one. Things are now better, however, and petrol and oil are obtainable at cheaper prices than at home, petrol costing somewhere about 2s. per gallon and oil about 4s. 6d., in small quantities.

Repairs are a vexed question. Spare parts for English machines are, of course, out of the question, except direct from home, while spares for German machines are to be had immediately from the agents, also certain American machines, notably Indian and Harley-Davidson. The Indian was the first machine to be represented here, a Cologne firm having secured the agency somewhere about the date of the ratification of peace. German mechanics, as far as repairs to motor cycles go, are hopeless. Some of the examples one sees here of sidecars off Douglas machines fitted to Triumph machines by German mechanics are enough to make one weep. The usual German idea seems to smother the whole affair with brightly coloured paint and cheap nickel-plating. The mechanical side of the question is ignored, and anything which has to be made specially is a hopeless bodge.

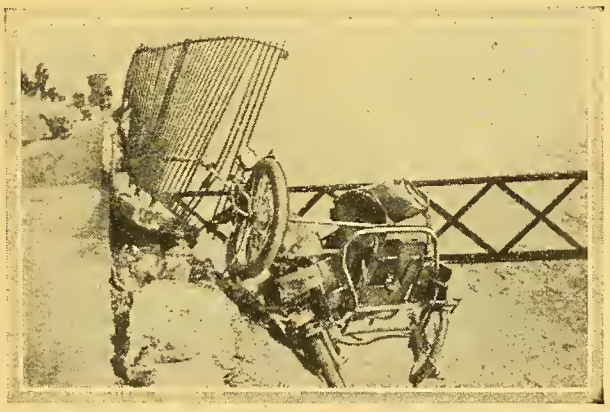
Mostly, the machines out here are Triumphs (solo and sidecar) and 4 h.p. Douglas sidecars—all ex-Army machines, and, consequently, most of them in hardly the best of condition. The writer uses a Victory model Matchless, 8 h.p. J.A.P., with additions. This turnout causes immense attraction wherever it stops, and the various Germans seem quite astonished to find a British machine that is not a Douglas or Triumph.

The roads here are fairly good, but are deteriorating. Those near the towns are bad, while those in the country, for instance, the Eifel district, are very fine; but, on the whole they are not good. The need for a properly sprung frame is very apparent; also large tyres. The N.S.U. machine is an example of a simple and efficient spring frame machine, without any gadgets, and as it has a 700×80 mm. back wheel (for a 4 h.p. model), it is a very comfortable machine to ride, and is capable of maintaining a high speed over atrocious roads without discomfort. However, for really bad roads, one must go to Belgium. The writer has twice travelled from Cologne to Brussels, and can say, without reserve, that he has never seen such awful roads before. The bad parts start some miles before Liège, and continue for a considerable distance past that place, the surface being *pavé*. Another stretch is that through Louvain into Brussels—about thirty miles—where it is positively dangerous to travel more than 10 m.p.h., owing to the danger of the front forks collapsing or the frame breaking.

Tyre trouble is very common, owing to the roads being mostly *pavé*, on which the various puncturing agents, nails, etc., rest, and do not get pushed into the road material, as they would if it were dirt or some such substance. It is no common occurrence to get four punctures on a short journey; while, a short time ago, the writer had no fewer than nine on a journey of 239 miles. Some sort of nail catcher is absolutely necessary.

Plenty of power is needed out here, if one would travel far afield and see the best scenery. Hills of four and five miles long are common, some of them needing second gear for a mile or two, and others are worse. For instance, two hills on the road from Trier (Trèves) to Mayen, near Andernach, on the road to Coblenz, where the writer recently came down for about 200 yards with the back wheel locked, and was totally unable to pull up—this with a studded Dunlop Magnum on the back wheel. These hills have several hairpin corners also. This is a main road, not a byroad. The road from Heimbach over the hills to the Gemünder Talsperre may also be instanced.—a sort of miniature Alpine pass, with about six or seven hairpin corners, mostly a second gear hill, and about five miles long altogether. C. E. CLARK.

Cologne.



When rectifying a defect in his lighting set, the Dublin owner of what remains of this Matchless sidecar outfit had the machine literally swept out of his hands by a runaway char-a-banc. Moral: keep out of the way of chars-a-bancs when attending to your lamps.

### WASTED SPEEDOMETER DIAL.

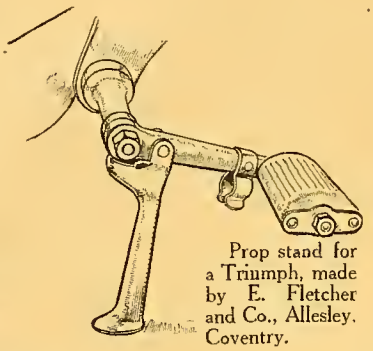
Sir,—What is the good of putting a speedometer which reads from 10 m.p.h. to 80 m.p.h. on a standard baby touring machine? Most seem to miss out the first five, and pack the next five into a quarter of an inch, ten to twenty in half an inch, and the rest of the figures spread out so that you can tell if you are going at 59¾ or 60. The only two that I have noted which start at 0 are the Bonniksen and the Stewart, but the latter goes up to 75, and 40 is enough for most people. X.Y.Z.

Birmingham.

### A PROP STAND.

Sir,—Herewith a prop stand which deserves no patent rights, it is so simple. I have fitted it on a Triumph, and it answers perfectly.

F. W. H. HARRIS,
E. FLETCHER AND CO.



Prop stand for a Triumph, made by E. Fletcher and Co., Allesley, Coventry.

### CLUTCHES FOR SINGLE-GEARED LIGHTWEIGHTS.

Sir,—In a recent issue you detailed the new Villiers engine-shaft clutch. I fitted this clutch to my 2½ h.p. two-stroke a few weeks ago, and have great pleasure in stating that it acts perfectly, and I consider it has greatly enhanced the value of my machine. There is now no need for a running mount: one can sit in the saddle, let in the clutch, and glide away. In traffic it makes all the difference in the world, allowing the rider to stop without stopping his engine, and to start again immediately the road is clear. The usual disclaimer. (REV.) H. MUDIE DRAPER.

### UTTERLY AMAZING SPEEDS.

Sir,—At not infrequent intervals correspondents to your eagerly read periodical, whilst writing of other subjects, throw in a casual reference to the utterly amazing speeds it is the daily habit for them to perform on their ordinary touring machines. In some instances their inherent modesty impels them to claims of noviceship in the self-same breath proclaiming their Brooklandian speeds. The temerity even to whisper of some of the mad meteoric speeds boldly claimed by them is beyond such a timid nature as mine, but I do dare refer to one of the more modest, to wit, a standard Triumph, which, with an avowed novice as driver, will "do 60."

Super-abundant and concentrated bitterness only has attended my efforts to persuade similar "ordinary standards" to attain such a delirious bustle as a mile a minute.

Would the illustrious omniscient ones impart of their wisdom, and thus show the lowly of intelligence how it is done? ENFIN.

Bromley.

### UNDER-INFLATION OF TYRES—AND THE EFFECT.

Sir,—I have just read with interest your correspondent "Ixion's" remarks on the subject of stone cuts. The reason for their prevalence is, I am convinced, the fact that, owing to the present shocking state of the roads, 90% of riders go about with their tyres under-inflated—at any rate, according to pre-war standards—because they prefer to let their tyres suffer, rather than their comfort.

I always drive my 6 h.p. sidecar with the tyres as hard as I can get them, and in the course of 8,000 miles covered in about a year, including a certain amount of competition riding, I have suffered no bursts and only three punctures (two of them on good main roads).

A short while ago I went down to Devonshire, and covered over four hundred miles in three days. I quite forgot I had pneumatic tyres on the machine, both on account of freedom from trouble and of soreness that persisted for days after my return!

Until the roads are improved, there would appear to be no way out; either tyres or bones must suffer. Personally, I prefer the latter, as it costs nothing, and is only temporary in its effects. OLIVER H. CLARK.

### LUCK.

Sir.—It is not often that one strikes such luck as I did a short while ago. The back tyre of my motor cycle punctured—a two inch gash—on a very stony byroad in hilly country; I had been very foolish in venturing alone there. To my dismay I discovered that I was without a repair outfit, and, according to the map, it was four or five miles to a village of any size. The prospect was far from pleasant: there was a long wearisome push in front of me.

I was contemplating the hills I would have to get up, when, at that very moment, a big motor spirit lorry appeared round the corner. It was practically empty! Before long, the machine and I were "on board" making for a garage in the next village, five miles distant. H. S. PRATT.

### WOOLLY THROTTLES.

Sir,—Thinking your readers might be interested, I venture to relate a little experience that befell me the other evening when returning from a run.

After slowing up near Hammersmith to allow passengers to board a tramcar, I engaged gears, and was preparing to accelerate when my machine gave a roar and stopped. On checking over, I found everything in apparent good order—plenty of petrol, valves O.K., gears properly home, etc. Mystified I put the machine on the stand, and was walking round to the near side to inspect the magneto when I felt a tug at my neck.

The "mystery" was solved. The day being cold I was wearing a very long scarf of fine wool, which I allow to hang almost to my knees. It had worked free from underneath me, and one end had been sucked through the long air pipe fitted to Amac carburetter on the Sports Sunbeam, and was firmly wedged in the slides. S. F. SEYFRIED.

[Instances of this kind spoiling a non-stop run in a trial have been recorded.—ED.]

### AFTER PROLONGED USE.

Sir,—I have thought for some time if riders who have used a motor cycle for a long period, say, 15,000 miles and over, would detail a list of replacements used during this period it would be interesting to see if readers could indicate the make of machine used. If they can do so with reasonable certainty, surely manufacturers would gain as much knowledge of notorious weak parts as any trial could supply.

I have just completed 17,000 miles since June, 1919, using my machine daily winter and summer, and the following is a list of new parts required: One new fork spring, two pairs of tappets and guides, one new exhaust valve and three springs, three new bearings for the pulley side of S.A. gear box, one new rear spindle and two sets of cones, one new set of head races complete, six new Bowden controls for the clutch, and one new gudgeon pin and bush.

The main engine races, big end timing bushes, etc., show no appreciable wear. The machine, a 4 h.p. Triumph, was purchased from W. H. Else and Co., June, 1919.

CHARLES L. WILLCOX (Major).

## Books & Maps for Motor Cyclists.

Issued in conjunction with *The Motor Cycle*.

**"MOTOR CYCLES AND HOW TO MANAGE THEM."**
The standard handbook on the motor cycle.
Price net, 2/6. By post, 2/10

**"HINTS AND TIPS FOR MOTOR CYCLISTS."**
New Edition. Just Published. Price net, 2/- By post, 2/3.

**"TRACING MOTOR CYCLE TROUBLES."**
A system for tracing motor cycle faults and of remedying them when found. Fourth Edition.
Price net, 2/- By post, 2/3.

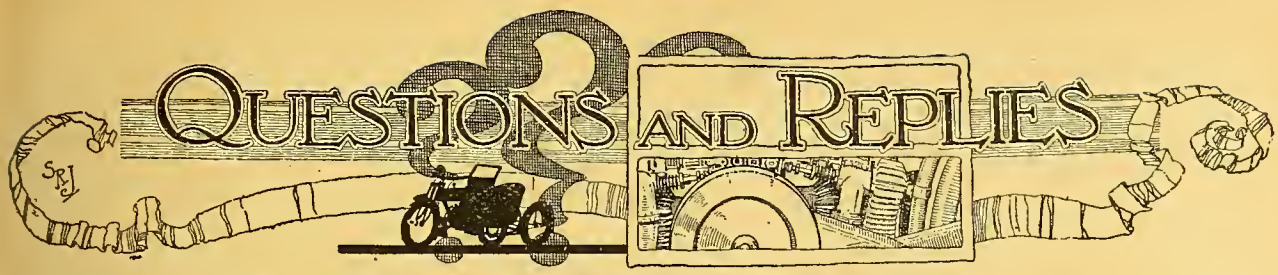
**"TWO-STROKE MOTOR CYCLES."**
A reliable treatise on Two-strokes, from the rider's point of view. Price net, 3/- By post, 3/3.

**"MOTOR CYCLE REMINISCENCES."**
By "Ixion," of *The Motor Cycle*.
Price net, 5/- By post, 5/3.

**"THE MOTOR CYCLE" ROAD MAPS.**
Set of Three Maps—England and Wales, Scotland, London. Set of three, complete in case. Price net, 5/6. Post post, 5/10. Set of Two Maps—England and Wales, London. Price net, 4/6. By post, 4/8.

**"THE MOTOR CYCLE" ROUTE BOOK.**
With 32 pages of Road Maps. Price net, 5/- By post, 5/4

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., Dorset House, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle, Dorset House, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the top left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

ROUTES.—By special arrangement with the Automobile Association and Motor Union, readers of "The Motor Cycle" desiring routes may enjoy the benefit of the Road Service Department of that organisation. Queries should be addressed to the Editor in the ordinary way (enclosing a 2d. stamp), and will be dealt with by the A.A. and M.U., who are regularly in receipt of reports from their representatives all over the country as to the existing state of the roads in any particular locality.

### MAGNETO FOR 90° TWIN.

Will a 180° twin magneto be suitable for a 90° twin engine if run at twice crankshaft speed? —F.E.E.

A 180° twin-cylinder magneto running at twice crankshaft speed would be quite unsuitable for use with a 90° engine, as there would be a spark at the bottom of the induction stroke while the inlet valve was still open, and there would be in consequence every possibility of the carburetter being set on fire.

### REDUCING GEAR FOR SIDECAR WORK.

A sidecar recently having been fitted to my three-speed 4 h.p. Coulson B, I find it desirable to reduce the gear ratios. The engine-shaft sprocket has fifteen teeth, and is therefore quite small enough already; the countershaft sprocket has thirty teeth. (1.) How much larger should the countershaft sprocket be to give satisfaction? (2.) Where would you recommend me to get such a sprocket?—W.B.R.

(1.) The countershaft sprocket would need to be larger by three or four teeth. (2.) We do not know of anyone who would supply you with a new sprocket, as the makers only produce those with thirty teeth, and the sprocket is part of the clutch. It would be an easier matter to fit a smaller belt pulley, say one about 7in., in place of the 8in. pulley as fitted to the gear box. A number of firms specialise in the making of pulleys.

### NO SPEED.

Some little time ago I purchased a Sun motor cycle with a Villiers two-stroke engine of 1918 manufacture, single-speed model. The utmost speed I can get is about 20 m.p.h. Surely, this is very low? I decarbonised the engine a short time ago and fitted one new ring and a new gudgeon pin. I am using a 27 Amac jet, and with this can open full air quite easily; but after opening the petrol lever half-way no more speed is perceptible. The engine does seem to be fairly powerful, because it will pull up a hill just as fast as it travels on the level.—C.W.C.M.

Presumably the trouble is due to the ignition being permanently late. Time so that the spark occurs on top dead centre with the magneto control fully retarded; also make quite sure that the belt is not slipping, as this may account for a good deal of your trouble.

## Important Dates.

**Fri., Jan. 27th, to Sat., Feb 4th—Scottish Car and Motor Cycle Show.**

**Sun., Mar 5th — Argenteuil Hill-climb (France).**

**Mon., Mar. 6th — La Turbie Hill-climb (Nice).**

**Wed., Mar 15th—A.C.U. One-day Trial for Stock Machines.**

**Thurs., Mar. 23rd—East Midland Centre A.C.U. Open Reliability Trial.**

**Sat., April 1st—Western Centre A.C.U.—Open Hill-climb.**

**Sat., April 8th—B.M.C.R.C., Members' Meeting at Brooklands.**

**Fri., April 14th, and Sat., April 15th—M.C.C. London-Land's End Run.**

**Sat., April 22nd—N.-Eastern Centre A.C.U. Open Reliability Trial.**

**Sat., April 29th—S. Midland Centre A.C.U. Open Hill-climb.**

**Mon., May 1st, to Sat., May 6th—Scottish Six Days Reliability Trials**

**Sat., May 13th—Northern Centre A.C.U. Open Reliability Trial**

**Sat., May 20th—S.-Western Centre A.C.U. Open Reliability Trial.**

**Tues., May 30th—Junior Tourist Trophy Race.**

**Thurs., June 1st—Senior Tourist Trophy Race**

### DISADVANTAGES OF SIDE-BY-SIDE TWIN CYLINDER ARRANGEMENTS.

Can you tell me why on one occasion when describing certain French machines you referred to side-by-side twin four-strokes as being probably the most unsuitable engines for motor cycles? Is it in connection with firing periods or balance, or do both cylinders fire at the same time? I should like to say I admire the appearance of machines using this type of engine.—A.A.

The great objection to side-by-side twin-cylinder engines is that, if the crank is arranged so that the firing intervals are equally spaced, the balance is no better than that of a single-cylinder engine; whereas if good balance is obtained, the firing intervals (in a four-stroke engine) are uneven, and the torque is bad. Moreover, in the latter case (when the cranks are set at 180°) there is an objectionable "couple" caused by the off-setting of the two throws of the crank, which tends to set up an excessive amount of vibration, especially if the distance between the axes of the cylinders is very great. This vibration is very noticeable when the engine is set across the frame.

### CHARGING FROM A LIGHTING CIRCUIT.

I purpose fixing up a resistance for charging accumulators without using lamps or at most two lamps. Kindly tell me what I shall require to pass 2-2½ amps. on a circuit of 230 volts.—W.J.H.

It is certainly possible to charge accumulators from a 230 volt circuit, provided the current is continuous and not alternating. This method of charging is not at all economical, and is not really to be recommended for occasional work. You would obtain fuller information on the subject in any of the popular handbooks dealing with small electrical apparatus.

### CHANGING OILS.

In a recent article it was stated that it was injurious to the engine to change lubricating oils. I have a 1920 8 h.p. Sunbeam outfit, and have frequently changed oils when the particular recommended brand was unobtainable. I have always made sure that it was a good oil I used (known maker and sealed tins, etc.), and I would be glad of your assurance that I have not been wrong in doing this.—W.J.T.

It is not absolutely injurious to the engine to change lubricating oils, provided that the new oil is of the same base—that is, if a mineral oil has been used, the change to another mineral oil of different brand will do no harm, provided it is suitable for the engine in other respects. With your machine any good brand of air-cooled oil in sealed tins should be satisfactory.

### LIGHTING NUMBER PLATES.

Recently I was pulled up by a policeman, who said: "Why haven't you one of your number plates illuminated?" I told him the rear one was. He said: "It is, but not sufficiently; one (the front or the rear) must be illuminated so that it can be read at a distance of forty yards away." I am not quite sure whether a number plate need be illuminated on a solo motor cycle. My rear lamp is an ordinary one with a small lens in the side.—L.W.R.

It is necessary that one number plate shall be clearly illuminated even on a solo machine. If the front numbers are illuminated by the head lamp, there is no need to illuminate the rear number plate. They must be easily read, of course. At the present time it is not necessary to carry a rear light on a solo machine

## READER'S REPLY.

### CHOOSING A COMMERCIAL TRAVELLER'S MACHINE.

I notice "S.L.S.," a commercial traveller, asking for advice in choosing a suitable mount. Having in daily use for business and pleasure an 8 h.p. Matchless-M.A.G., I should strongly advise him to get a similar machine, which will give him excellent results, and, in my opinion, is the finest business proposition in motor cycles—a machine built to "stand up to it." I know that I am not alone in this opinion. Of course, I fully understand that "S.L.S." asked about a lightweight, and also that he says his means are very limited. Still, notwithstanding this, I would strongly advise him to make it a Matchless. The spring frame is greatly appreciated on the present-day road surfaces.—W.R.C.

## EXPERIENCES WANTED.

*Readers' replies to questions published under this heading should be sent to the Editor, "The Motor Cycle," Hertford Street, Coventry, when they will be forwarded direct to the querists concerned.*

"R.E.K-P." (Deal).—Speed, silence, comfort, and economy of the 5 h.p. N.U.T. and 5-6 h.p. Raleigh.

"A.B.C." (Shrewsbury).—Tube protectors and other puncture-proof devices.

"C.C.L." (Harringay, N.).—Any kind of puncture-proof band for inserting between the cover and tube of driving wheel of sidecar outfit, slowing effect, chafing of inner tube, etc.

"W.W.L." (Woldingham). — Degory and Mills carburetters on 2¾ h.p. Douglas.

"T.G." (Harrow).—Best carburetter and adjustment for 1916 5-6 h.p. Clyno sidecar, with extra passenger.

"H.R." (Motherwell). — Will this reader please forward his address?

"J.W.B." (Birmingham). — Tuning hints for speed with 4 h.p. Douglas (solo and sidecar), W.S.R. or similar variable jet adapters.

"J.F." (Scarborough). — Ner-a-car: Consumption, wear on friction drive, climbing, reliability, and comfort.

"W.H.E." (Ormskirk).—4 h.p. 1921 Blackburne, solo or sidecar: Reliability, consumption, and general hints.

### Lighting from the Magneto.

An electric lighting equipment which derives its current from the magneto will shortly be marketed by F.R.S. Lamps, Vere Street, Birmingham. It is only suitable for single-cylinder machines.

### A Satisfactory Liquid Soap.

Some time ago we received a sample of Horto liquid soap. Unfortunately, the makers' name and address is not on the tin so we are unable to give credit where it is due. This soap, which is particularly effective in removing dirt and grease, lathers well even in the hardest water.

### Scooter Price Reductions.

A general reduction in price has been made on the Autoglider machines, which are now made by the National Manufacturing Co., of 19-20, Charlotte Street, Birmingham. The 1922 figures now range from £30 to £45, with £3 10s. extra for a handle-bar clutch. Spare parts for the machines made by Autogliders, Ltd., are available from stock.

### Chain-driven 6 h.p. Ariel Retained.

At the Olympia Show it was projected that the 6-7 h.p. Ariel would be sold with belt final drive only, the all-chain model being equipped with an 8 h.p. engine. It has now been decided to continue the 6-7 h.p. all-chain model as well, its price being £117 or £152 10s. with sidecar.

### Running Hints for Morgan Drivers.

Some useful wrinkles concerning the maintenance of the Morgan Runabout are embodied in a booklet recently issued by the Morgan Motor Co., Ltd., of Malvern. The instructions are rendered clear by excellent sketches and photographs, and special information is given regarding lubrication. A list of spares is also given.

### An Unlimited Guarantee against Valve Breakage.

In a catalogue just received from G.R.I. Motors, Ltd., of 79, West Regent Street, Glasgow, particular attention is drawn to the fact that the poppet valve of the 350 and 500 c.c. Gri engine is guaranteed for an indefinite period. It will be recollected that in this engine use is made of a combined rotary distribution valve and a single poppet valve, which controls the exhaust opening and inlet closing, remaining off its seating throughout the whole of this period. These valves are situated in the cylinder head and driven by roller chain.

### Catalogues Received.

Saxelbys, Ltd., St. George's Works, Coventry: Under the general name of Saxessories are described in a twelve-page list pillion seats, auxiliary seats for children and adults (suitable for use in sidecars, cycle cars, or cars), and a variety of chain rivet extractors for cycle and motor cycle chains.

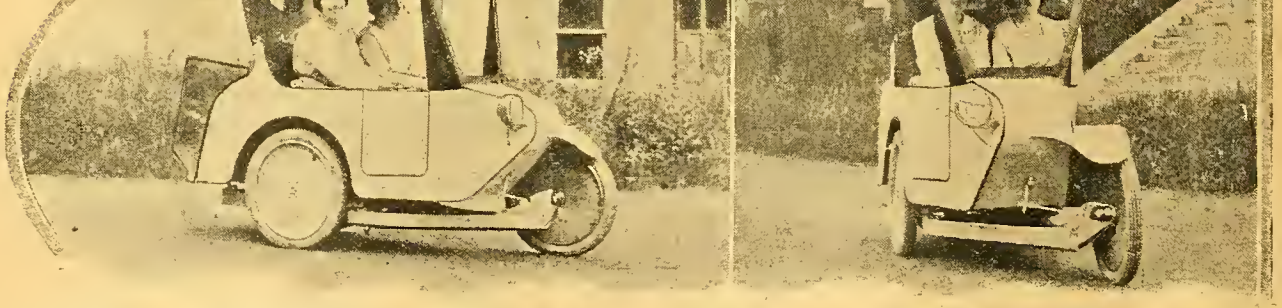
Moss Gear Co., Ltd., Crown Works, Aston Manor, Birmingham: A complete description of the Moss three-speed lightweight gear. Useful hints on the care and adjustment of the box are carefully described and clearly illustrated, and a spare parts list is included.

J. B. Brooks and Co., Ltd., Great Charles Street, Birmingham: Leaflet describing the Brooks cantilever saddle and showing method of attachment to the motor cycle carrier.

New Imperial Cycles, Ltd., Princip Street, Birmingham: A leaflet giving particulars and prices of New Imperial solo and sidecar machines, including the 250 c.c. model, which won *The Motor Cycle* Cup in the lightweight class of the Junior T.T.

W. and F. Wills, Ltd., Bridgwater: Price list of cylinder grinding, including cost of fitting new pistons.

A. E. Radnall and Co., Vauxhall Works, Dartmouth Street, Birmingham: Leaflets concerning the 1922 Radco motor cycles and sidecars, dealing with the 2½ h.p. sidecar outfit and four other two-stroke models, amongst which a lady's model with drop frame, two-speed gear, clutch, and kick-starter may be mentioned.



In following the general idea of the Scott Sociable, the Martin Rocking Fifth Wheel Co., of Springfield, Mass., U.S.A., has aimed at extreme simplicity. This company's machine, known as the Scootamobile, is said to be capable of 30 m.p.h. on a petrol consumption at the rate of 75 m.p.g.

# Logic

When you find certain machines which year after year put up good performances in Reliability Trials, and compete with success in the great race in the Isle of Man—you can be sure they will give you good service on the road.

When you find a firm of Agents—keen riders with a long record of successes on both road and track, who have enjoyed for 12 years the confidence of Motor Cyclists—then you can be equally sure of the best of service, and can rely on their advice in the selection of a new machine to suit your special needs.

GODFREY'S have the finest selection of new 1922 Models, and cordially invite you to visit their Showrooms. Full lists and any catalogue sent on request.

**FOR CREDIT TERMS WE CHARGE ONLY 4%** Except in those cases where higher rates are fixed by the Manufacturers.

First deposit one quarter of the amount, and the balance in twelve equal monthly instalments.

If you desire us to take your present machine in part exchange send full particulars.

*A few examples selected from our full stock of New Models.*

# No More Punctures!

You will never again be stranded with a punctured tyre—never again dread bits of glass, flint, and nails, if you fit the **TUBE PROTECTOR.**

The Tube Protector is a flexible layer of thin pieces of hard metal (arranged as in a coat of mail) enclosed in canvas, and fits between the outer cover and the inner tube of your tyre. No matter what sharp matter pierces the outer cover, it cannot penetrate the Tube Protector—cannot possibly pass through to the inner tube.

The Tube Protector is easy to fit, is light in weight, and causes no friction. It allows you to wear down the outer cover to almost nothing Think of the saving in time, money, labour, and patience.

Ask your dealer to fit TUBE PROTECTORS to your motor cycle tyres

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns –First 12 words 3/–, and 3d. for every ad–itional word. Paragraphs of under 8 words re charged double rate. Each paragraph is harged separately. Name and address must e counted. Series discounts, conditions, and pecial terms to regular trade advertisers will e quoted on application.

Postal Orders and Cheques sent in payment for dvertisements should be made payable ____ & Co. ) ILIFFE & SONS Ltd., and crossed ____ reasury Notes, being untraceable if lost in ransit, should not be sent as remittances.

All advertisements in this section should be ccompanied with remittance, and be addressed ) the offices of "The Motor Cycle," Dorset louse, Tudor Street, London, E.C.4, or 19, lertford Street, Coventry. To ensure insertion etters should be posted in time to reach the ffices of "The Motor Cycle," by the first post n Friday morning previous to the day of issue. dvertisements that arrive too late for a par-ular issue or that are crowded out will auto-natically be inserted in the following issue unless ccompanied by instructions to the contrary.

All letters relating to advertisements should uote the number which is printed at the end of ach advertisement, and the date of the issue which it appeared.

The proprietors are not responsible for clerical printers' errors, although every care is taken avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be dressed to numbers at "The Motor Cycle" Office. hen this is desired, the sum of 6d. to defray the cost of gistration and to cover postage on replies must be added the advertisement charge, which must include the rds Box 000, c/o "The Motor Cycle." Only the number ll appear in the advertisement. All replies should be dressed No. 000, c/o "The Motor Cycle," Dorset Honse, idor Street, London, E.C.4. *Readers who reply to Box No. vertisements are warned against sending remittance through e post except in registered envelopes; in all such cases the e of the Deposit System is recommended, and the envelope ould be clearly marked "Deposit Department."*

In the case of motor cycles offered for sale under a box mber, as it is unusual for these to be sold without first ing inspected by the intending purchaser, advertisers will cilitate business by embodying in their advertisements me mention of the district in which the machine fered may be seen and tried.

## ☞ DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons ay deal in perfect safety by availing themselves of our posit System. If the money be deposited with "The otor Cycle," both parties are advised of this receipt. The time allowed for a decision after receipt of the ods is three days, and if a sale is effected we remit the ount to the seller, but, if not, we return the amount the depositor. Carriage is to be paid by the buyer, but the event of no sale each party pays carriage one way. ie seller takes the risk of damage in transit. For all ansactions up to £10, a deposit fee of 1/- is charged; on nsactions over £10 and under £50, the fee is 2/6; over o and under £75, 5/-; over £75 and under £100, 7/6; d on all transactions over £100, 1%. All deposit atters are dealt with at Dorset House, Tudor Street, ondon, E.C.4, and cheques and money orders should be ade payable to Iliffe & Sons Limited. The letter "D" at the end of an advertisement is an lication that the advertiser is willing to avail himself of e Deposit System. Other advertisers may be equally sirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no swer to their enquiries are requested to regard the ance as an indication that the goods advertised have eady been disposed of. Advertisers often receive so any enquiries that it is quite impossible to reply to ch one by post.

## MOTOR CYCLES FOR SALE.

### A.B.C.

A.B.C., 1921, new condition; £75.—Clark, 7 Exhibition Rd., S.W.7. [2941

Sole London and District Distributing Agents for A.J.S., Excelsior, and Dunelt Motor Cycles.

THERE is far more satisfaction and much greater security in buying a good machine from a reliable Agent than in picking it up anywhere—you know what we mean. Taylors have 12 years of honest trading at the back of them, and a reputation second to none amongst Motor Cycle dealers. There is a reason!! Taylors have always made it their business to take just as much interest in their customers as in their prospective customers; in other words—Taylors give real service.

**SOME TYPICAL EXAMPLES OF MOTOR CYCLE VALUE**

**A.J.S.** 7 h.p. Comb. **£175**
**A.J.S.** 2¾ h.p, Sports **£85**

***How is it done?***

***Where is the Profit? you will ask.***

**We can assure you there is no profit, but a very considerable loss on our own cost on every one of those machines—but we sell such large numbers during the season that we can afford to lose on what are left over at the end of the year.**

## OUR LOSS IS YOUR GAIN IF YOU NOW SEIZE THE OPPORTUNITY.

CONTINENTAL Ignition Repair Co., 13, Hardwick Rd., Chiswick, London. [3758

## IGNITION, LIGHTING, ETC.

RELIANCE Magneto Repairing Co. for repairs and new magnetos.—See below.

RELIANCE guarantee to return your magneto within 3 days, and if necessary 24 hours, with a written guarantee for 12 months.

RELIANCE test every magneto after repair under all running conditions, and, as we contract for many of the largest concerns, you need have no hesitation in placing your repairs and orders with us.

RELIANCE manufacture and stock spares for Thomson-Bennett, E.I.C., Splitdorf, U.H., Bosch, Dixie, etc.; special line genuine platinum sciews for every make, 12/- per pair

RELIANCE will be pleased to give advice free of charge upon any question concerning ignition troubles, as we place our long-standing experience at your disposal, and old and new customers may be certain of getting the usual promptness and courtesy that we have always endeavoured to give.—Reliance Magneto Repairing Co., 283, St. John St., London, E.C.1.

RELIANCE Magneto Repairing Co., 283, St. John St., E.C.1, for new and second-hand magnetos.—See below.

THOMSON-BENNETT Magnetos, new and unused, single-cyl., clock and anti, suit any machine, price 55/-; twins, 45, 48, 50, 55, 60, 180 degrees, for J.A.P., Clyno, Douglas, etc., price 55/-. See our guarantee.—Below.

C.A.V. Magnetos, new, single-cyl. and 180° twins, clock or anti, ideal for Douglas, Levis, Calthorpe, O.K., or any lightweight; these magnetos are of the finest workmanship throughout; price 55/-. See our guarantee.—Below.

BOSCH D.A.L. Magnetos, soiled only, otherwise as new, single cyl., suitable for any stationary engine or big single, £3/15; twins, any degree, ready to drop on Indian, Harley, or any big twin, £4/5; a powerful spark at low speed, ensuring easy starting. All the above magnetos are variable ignition and fitted short-circuiting switch. See our guarantee.—Below.

GUARANTEE. — Every magneto that leaves our works, no matter what the price or make, carries a written guarantee. Not merely a guarantee that same is in good order at time of sale, but a plainly written statement that we guarantee every machine against all defects for a period of 12 months. This, we maintain, justifies us in charging a few shillings more than certain of our competitors.

RELIANCE Magneto Repairing Co. hold one of the largest stocks in London, and can be depended upon for a straight deal at the right price. When buying it pays to deal with a firm of repute.

RELIANCE cordially invite customers to their works to see any of the above on test. Magneto list giving full particulars sent upon application.—Reliance Magneto Repairing Co., 283, St. John St., London, E.C.1. [6616

C.A.V. Magnetos: Extraordinary Bargains.—Brand new 180° twin or single-cyl., 39/6, carriage free. Every magneto thoroughly tested before dispatch; approval against cash.—Langford's, 37, Cricklewood Broadway, London, N.W.2. [3514

MAGNETOS.—Surplus 400, new, with sets of spares, Bosch, C.A.V., B.E. Co., Dixie, E.I.C., Eisemann, Ericsson, G. and A., Hill, Morris Lister, Simms, Splitdorf, Thomson-Bennett; inspection in London.—Full particulars from Honeywill Bros., Machinery Department, 79, Mark Lane, London, E.C.3. [3759

SURPLUS Magnetos (with written guarantee one year). —M-L single, 35/-; B.L.I.C. ditto, advance-retard, 42/-; Bosch ditto, 45/-; Thomson-Bennett and C.A.V. singles and twins, 50/-; spares for all makes; magneto repairs of every description.—Whitdale Magneto Service, Cherry Orchard, Croydon. 'Phone: Croydon 1625. [2585

**30/-** Each.—Not the price of a small repair job. Splitdorf magnetos, single, anti, variable ignition, and guaranteed. These are the real thing, not converted starter magnetos (the only fault is, we sell them too cheap); 30/- each.—Marble Arch Motor Exchange, 135, Edgware Rd., W.2. 'Phone: Padd. 789. [2965

THE Magneto Repairing and Winding Co. (established 1912), contractors to H.M. Government, and officially appointed by the R.A.C. # FOR YEARS!

manufacturers have been striving to evolve a steel that would stand up indefinitely to the high and heavy duty required in valves of high speed engines. At last it has been solved.

I am now in a position to supply a limited number of valves for 4 h.p. and 2¾ h.p. Douglas Engines that are **unbreakable**, and to prove my word every valve that I sell will carry my mark and number, and will be guaranteed for 12 months from the date of delivery. If, during that time, despite how many thousands of miles you have covered in that period, one of these valves break, return it and the invoice, and get your money back. In addition to being

**UNBREAKABLE**

**It does not**
**PIT**
**It does not**
**SCALE**
**It does not**
**BURN**
**It rarely needs**
**Grinding In;**
**It, therefore,**
**Saves the Seating**
**and prevents**
**Air Leaks**
**as the stem is very hard and does not wear in the guides.**

Obviously, the valve is expensive, and is likely to be until the steel can be produced in extremely large quantities, but I know of manufacturers who, to-day consider the value of an unbreakable valve almost priceless. Rumour in last season's T.T. Race told us of wonderful valves which cost £5 each, yet I doubt whether they were unbreakable as mine are. Considering the quality, 9/- for 2¾ h.p., and 10/- for 4 h.p., are quite reasonable, Orders will be executed in strict rotation.

**Trade Enquiries Invited.**

Valves for any other make of engine or car made to order in single sets 14 days from date of order.

Prices on submitting samples.

*W. G. Coram*

*Official Douglas Agent,*
**140, Victoria Street, BRISTOL.**
Telephone 3792.

## The Dates of the T.T.

IN the last two or three issues of *The Motor Cycle* we have discussed the suitability of the dates chosen for this year's Tourist Trophy races. The view has been expressed in many quarters that the Tuesday and Thursday of the week preceding Whitsuntide cannot be regarded as the most suitable to ensure a representative entry from the trade, since the week prior to this Bank Holiday is quite the busiest of the manufacturers' year. In view of the opinions which were published in *The Motor Cycle* from the different manufacturers and riders on the subject of the dates, we are informed by the secretary, Mr. T. W. Loughborough, that the Auto-Cycle Union Management Committee met and considered the matter afresh, and it must be confessed that, after careful reinvestigation, an easy solution of the difficulty is not clearly apparent.

The Isle of Man authorities have been consulted with regard to other dates, and have agreed to Tuesday, May 23rd, and Thursday, May 25th, being available if the A.C.U. decide to hold the races a week earlier. The only objections raised against this course are the slightly reduced daylight available for practising, and the fact that only a single daily service of small steamers could be relied upon. If the Isle of Man Steam Packet Co. could be prevailed upon to extend the facilities they have offered for a double daily service one week earlier, the air would be cleared.

The A.C.U. has further considered the advisability of anticipating the present date by one day, *i.e.*, holding the event on the Monday and Wednesday, but then difficulty arises as to the examination of the machines, which, it is apparently thought, must take place the day prior to the race.

Of the different alternatives discussed, and knowing as we do the feeling of an important section of the trade and T.T. following affected, a decision to hold the events on Tuesday, May 23rd, and Thursday, May 25th, would be calculated to give the greatest satisfaction.

In urging this course we should like to make it quite clear here that our sole interest in the question of the dates is to see that the greatest number is satisfied, and we fully appreciate the quandary in which the A.C.U. is placed. The Tourist Trophy race is regarded as the blue riband event of the motor cycling world. Any factor which is likely to detract from the importance of the race is to be deprecated.

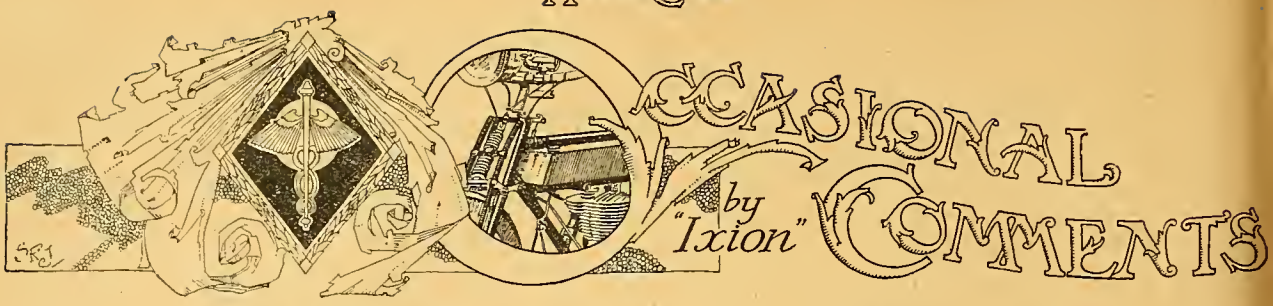
We understand that the position at present is that the A.C.U. has laid the facts before the Manufacturers' Union, whose representatives will no doubt consider the matter further and find a way out of the present *impasse*. In brief the makers of the Norton, Sun, New Comet, Velocette, Levis, New Imperial, Ivy, Omega, Scott, N.U.T., Hobart, and Indian, have given it as their opinion that the date a week preceding the Whitsun Holidays is unfortunate from the manufacturers' point of view, quite apart from the expressed opinion of the leading agents and riders, and, in view of this evidence, the subject cannot lightly be dismissed.

## An Amateur T.T.

SEVERAL correspondents have proposed an amateur T.T. race—an excellent suggestion, but one not so easy to follow as it would at first seem. The whole question depends upon the definition of an amateur. In the early days of cycling the National Cyclists' Union attempted to define an amateur and failed hopelessly. Since its foundation nineteen years ago the A.C.U. has often discussed the same matter, but has likewise failed, and the problem seems to be insolvable.

At the present moment a private owner is perfectly at liberty to enter for the T.T., but unless he is a super-man on a super-machine he has little chance of getting placed, to say nothing of winning. Nevertheless, private owners do enter every year, and we greatly admire their sportsmanship.

An index to the advertisements in this issue will be found on the page facing the back cover.



### Territorial D.R.'s

READERS "who belong" tell me that a territorial D.R. section makes a delightful motor cycle coterie. This being so, it is rather surprising that some of the signal companies are far below establishment so far as D.R.'s are concerned. For example, I hear of one London signal company which is over threequarter strength, and yet has so far attracted but one solitary D.R. in lieu of the twenty-first figuring on establishment. Any readers interested in such openings should enquire at the nearest territorial headquarters.

### Another Puzzle.

A READER forwards another brain-tester for motor cyclists on winter evenings. Bramco, Ltd., of Coventry, advertise stationary engines to run on fuel oil or paraffin, and their folder states:

NO { carburetter. vaporiser. hot bulb. magneto. battery. spark plugs. coil. wiring.

He enquires, "How does the beastly thing go?"—and enquires for a motor cycle engine of similar simplicity.

### Jekyll and Hyde.

SUDDEN discoveries that our friends lead double lives are very painful. To think that I have known that sound motor cyclist, H. Mortimer Batten, all these years without suspecting that the motor cycle was not his only love. Scanning the Christmas volumes last month, what did I find but an opulent publication entitled "Habits and Characters of British Wild Animals" from his pen. Priced at a guinea, too. Judging from the press reviews, Batten is a man of parts. When he sees a sparrow seated on a bough with its head on one side, he knows exactly what it is thinking about, just as he knows what is the matter when his engine back-fires through the carburetter. Some years ago, I entered into the *vie intime* of another famous motor cyclist. His den, instead of being adorned with buckled connecting rods and hill-climb medals as I had anticipated, bristled with chessboards, and his daily post consisted mainly of postcards bearing such legends as "Kt to KB6" in twenty different languages. His books, instead of dealing with the internal combustion engine, were philosophical, and tackled such brain-twisting subjects as whether we actually exist, or merely fancy that we do. What a miserable one idea sort of a chap I am, compared to these stalwarts. I must take up Esperanto or vegetarianism!

### Belt-drive on the Peters.

A GOOD many visitors to Olympia, in company with no small section of the technical press, struck me as quite failing to recognise the significance of belt drive on the new Peters motor bicycle. For years past we have all prattled of the great yearning in the public breast for a "Ford" motor bicycle. Considering that the Peters specification includes a fully-sprung frame and electric lighting at a price of fifty-five guineas, it may rank as the nearest approach to the Ford two-wheeler which we have yet seen. Let us grant by all means that belt drive is obsolescent in that stratum of the motor cycle world where cups and speed and medals are the only things that really count. On the other hand, belt-drive is the cheapest transmission going from a production standpoint. It is the lightest drive available from the standpoint of a weak and lazy driver. It is the simplest and cheapest drive from the standpoint of a man who wants to keep repairs down to the minimum. From a road point of view it is—in conjunction with such an infinitely variable gear as the Peters, Rudge, or Zenith—far, far pleasanter than a two-speed gear and chain drive (the only known alternative on a "Ford" bicycle). *Reliability up steep hills in bad weather* is its one and only crab; and even this crab only becomes serious if a sidecar is attached. Now the Peters is a 350 c.c. two-stroke—obviously a solo mount, pure and simple. Moreover, 90% of the potential buyers of a "Ford" bicycle live in flattish districts. So don't you agree that the Peters man knew what he was doing when he laid out a belt drive?

### Belts at their Best.

SINCE the autumn of 1920 I have personally run a small two-stroke with combined drive as a utility runabout, and in the whole of the period I have never had to touch either the belt or its fastener. It is true that the machine has not done a colossal amount of steep hill work, but it has often been out in rain, and frequently clambers up half a mile which brings practically all cars down to their bottom ratio. The record struck me as unusual, and I asked in this column for similar experiences. I received quite a lot. My conviction is in solo work over ordinary roads with a light load and a front pulley of decent diameter a good, modern ⅞in. or 1in. belt will run tremendous distances without causing its owner any trouble at all. Heavy loads (especially sidecars), engines with a jerky torque, undersized belts (1in. behind 8 h.p.), stunt driving, and worn pulleys are to blame for most of the belt exasperation which one remembers. The average ratio on which the belt of such a machine as the Peters will run is

**Occasional Comments.—**

probably over 5 to 1; and under such conditions a belt should give excellent service. To my mind, it would have been rank bad policy to put a gear box and a chain on the Peters.

### Yet Another Argument.

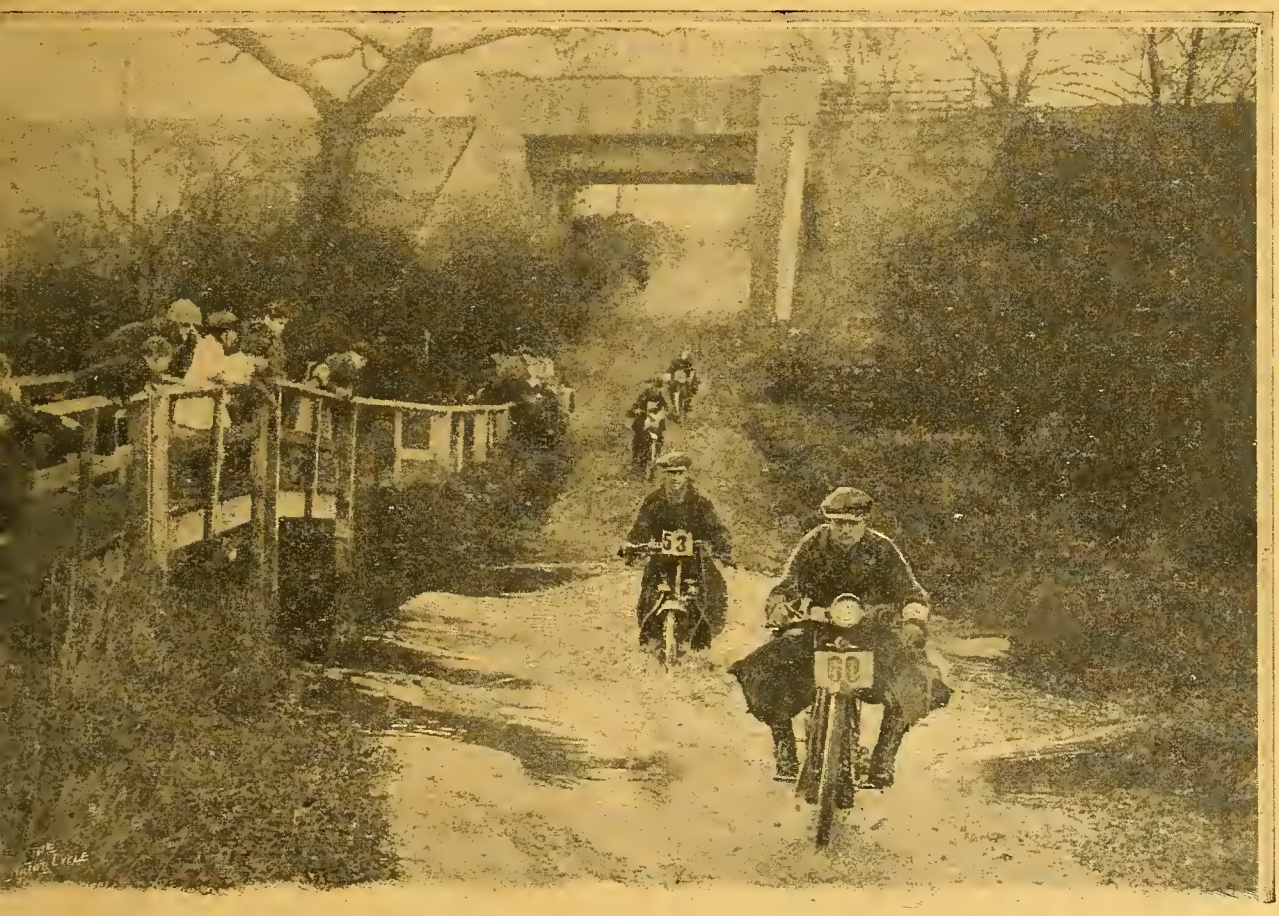
ANY rider who has comparative experience of lightweights with two and three-speed gear boxes respectively will plump for a three speeder every time. The lack of a middle ratio tends to inspire a top which is too low, and a bottom which is too high. On the road these faults imply engine fuss when hogging, and anxiety on encountering a really bad hill. Most makers of chain-drive layouts quote for a three-speed box as an option, and the extra charge is round about £5. If the variable belt drive is genuinely applicable to lightweight propositions, as the Peters proclaims, you get about a dozen gear ratios; and instead of paying extra for them, you actually save money on them. It is unquestionably a great pity that our big trials, as heretofore organised and run, definitely penalise such a layout as applied to the machines which logic equips with this drive. As a journalist, I would not attempt to report a modern Six Days on a belt driver. Few professional competition riders would voluntarily compete on such a drive. The conditions of a Six Days inflict the utmost penalty on such shortcomings as the drive possesses, and withhold from it every atom of credit which it can justifiably claim. In 1921 the A.C.U. broke new ground by taking note of oil and petrol consumption. Perhaps in 1922 they will see their way to recognise low weight and small cost.

### Flywheel Lighting Dynamo.

AT the Show many visitors to the gallery stared at the brilliant light flung abroad from the Villiers flywheel, and on their return to lower levels they gazed at the large outside flywheels on some of the big four-stroke engines. Then they fell to wondering when four-strokes would enjoy the benefits of flywheel lighting, and whether such installations would cost as much as the separate dynamos do!

### 350 c.c. to the Fore.

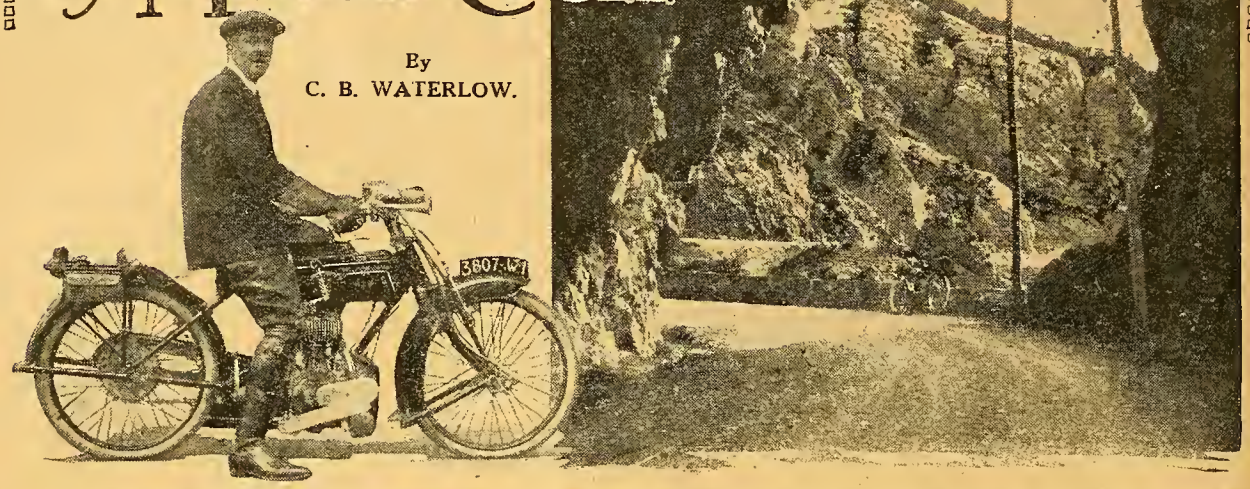
ADVANCE in design is nowhere more impressively demonstrated than in such programmes as the Raleigh and A.J.S. Both firms deliberately ignore the 500 c.c. engine which has dominated our touring market for so many years. Each firm selects a biggish twin for sidecar work, and specialises in a light, high-efficiency $2\frac{3}{4}$ h.p. for the solo man. It is only a few years ago that the thought of unrestricted touring on a $2\frac{3}{4}$ h.p. machine seemed like a Christmas nightmare. To-day many hardy spirits attach sidecars to machines of even less than 350 c.c., and manage to go almost anywhere with them.



WINTER OR SUMMER, RAIN OR FAIR, TRIAL ENTHUSIASM IS AS KEEN AS EVER IT WAS.
A scene in the Birmingham M.C.C. Christmas trial. The foremost riders are Brandish (Triumph), Randle (Scott), and Walford (Triumph).

# To the Riviera by Motor Cycle

By C. B. WATERLOW.



The writer and the A.J.S., on which he accomplished his ride to the South of France.

Just before reaching Castellane a minor Alpine pass has to be ascended. It presents some of the grandest and most rugged scenery of the whole route.

## A Motor Cyclist's Trip to the South of France.

TO thread the streets of Paris on a solo machine requires skill, enterprise, confidence, and a cool head; therefore, those motor cyclists who undertake the winter journey to the South of France, and the vastly greater number who make such a trip the subject of their contemplations, may avoid the heart of the capital by skirting round the fortifications, as the writer has often done.

Travellers landing at Dieppe or Havre, and avoiding Paris by passing through Rouen, Evreux, Dreux, and Chartres, can conveniently join the routes here described at Auxerre, which is also a good stopping place for the night.

Those who work out their own routes through France with the aid of Taride maps should note that the roads marked as being the largest and most important, generally along river valleys, almost always make far worse going than the smaller roads, because they are subject to heavy industrial traffic, and road repairs in France are not at present able to keep pace with the wear and tear of the great *routes nationales*.

Though familiar with the whole road from the Porte d'Italie, by which one leaves Paris, to the Côte d'Azure, the writer had not until recently accomplished this journey on a motor cycle. A $2\frac{3}{4}$ h.p. A.J.S., however, the first of its kind to find a permanent home in France, has now reeled off the kilometres of this long trail and made its *début* upon the Riviera.

More than six miles of *pavé* have to be negotiated after leaving the gates of Paris, and, though painful enough, it is not nearly so bad or so long as on certain other exits from the city, notably the main road to the battlefields round Verdun through Meaux and Château-Thierry, which has twenty miles of appalling *pavé*. Once through Juvisy the road to Fontainebleau is magnificent—a tarred surface, broad and straight, that makes one wonder why 40 m.p.h. seems so very slow.

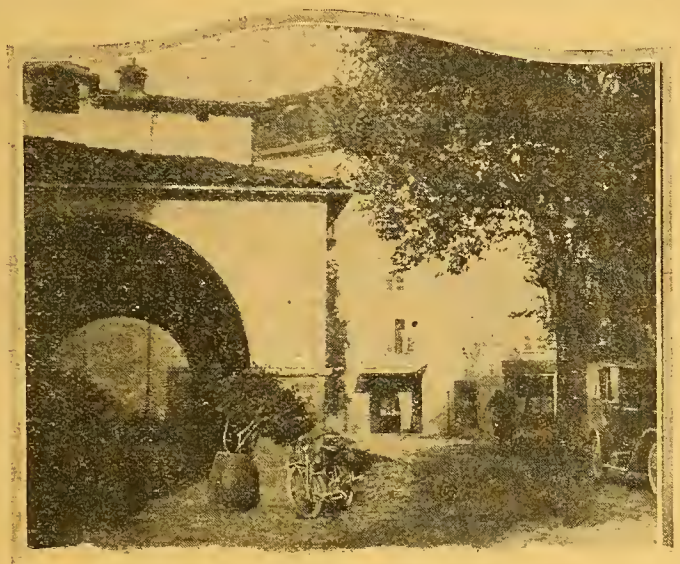
The Elephant Rock near Barbizon in the forest of Fontainebleau.

The forest of Fontainebleau, in autumn especially, is truly regal. There is also much that should be seen there if the wayfarer has time to spare. The whole region is a chaos of rocks and sand incapable of ordinary cultivation, and some of the rocks take fantastic shapes; there is one near the delightful village of Barbizon that is an excellent imitation of an elephant, and others take the form of gigantic stone mushrooms. The palace of Fontainebleau is a

**To the Riviera by Motor Cycle—**

museum of departed splendour and luxury, full of art treasures of great beauty, the nature and history of which are explained by a loud-voiced French guide.

Onwards to Sens, Villeneuve-sur-Yonne, Joigny, and Auxerre the road is generally in fair condition, and any of these towns can be recommended as a stopping place for the first night out from Paris; but Auxerre, 161 kilometres (about a hundred miles) from the capital, is particularly convenient and good as regards the accommodation obtainable.



Outside the Hotel du Levant in picturesque Castellane.

With the exception of the forest of Fontainebleau and a little of the valley of the Yonne at Joigny, the route so far is not remarkably picturesque; but, proceeding southwards from Auxerre to Avallon, this river valley is most lovely, especially in the mornings and evenings of still autumn days. Avallon is a delightful old country town with a very ancient cathedral, ramparts, and a wonderful panoramic view over the river valley, here deepened almost to a gorge. It is a convenient stopping place for lunch on the second day from Paris.

### Roads Not so Bad as Reported.

Southwards through Saulieu and Arnay-le-Duc to Chagny, the road is for the most part good, but the stretch that follows to Châlon-sur-Saône is notoriously bad, and must be taken slowly. Having traversed this road half-a-dozen times with different vehicles without breaking anything, I cannot agree with the articles on foreign touring published last spring in a certain important British daily, in which it was held that fractures are inevitable on this section of the route. One can, however, make a détour which will not cost much in distance by passing through the famous old town of Beaune, where the real vintages of Burgundy can be sampled in their native purity, and where the old *Hôtel de la Poste* has an excellent and well deserved reputation.

Châlon-sur-Saône is rather a tiresome town to get through, but one cannot go wrong by following closely the right bank of the river Saône, along which lies the main road to Mâcon and Lyon. It is best to avoid both these cities because of the state of the roads and the traffic and *pavé* of Lyon, and because the road further to the east is far more beautiful and also shorter than the Saône-Rhône valley route. Turning to the left, therefore, at Tournus, we make for Bourg-en-Bresse, which is a convenient stopping place for the second night, 248 kilometres (155 miles) from Auxerre, a distance usually quite sufficient for one day's run. For the last thirty kilometres into Bourg the road is almost perfectly straight, making one long for racing speeds.

### Amongst the Mountains.

From Bourg to Ambérieu the route follows the valley of the Ain, but after the latter town there comes a wonderful change in the scenery, and the traveller experiences fresh sensations. Bearing to the left the road plunges straight into the heart of the Jura mountains, the foothills of which will have been observed running parallel with the route all the way from Bourg. It is a fine piece of scenery, this passage of the Jura, and it is very remarkable that one reaches the Rhône valley on the other side of this range at Culoz without any serious climbing. The Jura mountains are full of clefts and defiles of this kind.

## PARIS TO THE RIVIERA.—Tabulated Itinerary with Hotels.

| | Distance. Kilometres. | Total. Kilometres. | Hotels. |
|---|---|---|---|
| Paris (Porte d'Italie) | | | |
| Fontainebleau .. | 55 | — | Numerous; Hotel de France et d'Angleterre (opp. Palace) is principal. |
| Sens ..... | 54 | 109 | Hotel de Paris, Rue de la République. |
| Villeneuve-sur-Yonne ..... | 13 | 122 | Hotel du Dauphin, Rue Carnot. |
| Joigny ..... | 16 | 138 | Moderne Hotel, Route d'Auxerre. |
| Auxerre ..... | 24 | 162 | Hotel de l'Epée, Rue du Temple. |
| Avallon ..... | 51 | 213 | Hotel du Chapeau Rouge, Rue de Lyon. |
| Saulieu ..... | 38 | 251 | Hotel de la Poste, Rue Grillot. |
| Chagny ..... | 57 | 308 | —— |
| Châlon-sur-Saône | 30 | 338 | Hotel Moderne, Boulevarde de la République |
| Tournus ..... | 28 | 366 | Hotel du Sauvage, Rue de la République. |
| Bourg-en-Bresse . | 44 | 410 | Hotel de l'Europe, Place Grenette. |
| Ambérieu ..... | 31 | 441 | —— |
| Culoz ..... | 55 | 496 | —— |
| Aix-les-Bains ... | 24 | 520 | Numerous, but mostly shut in winter: Hotel Dauphinois, Av. de Tresserve. |
| Chambéry ..... | 14 | 534 | Hotel de France, Quai Nezin . |
| Grenoble ..... | 56 | 580 | Grand Hotel, Rue de la République. |
| Pont de Claix .. | 8 | 588 | —— |
| Monestier de Clermont ..... | 26 | 614 | —— |
| Col du Fau ..... | 3 | 617 | —— |
| Col de la Croix Haute ..... | 32 | 649 | Touring Hotel at Lus-la-Croix Haute. |
| Sisteron ..... | 73 | 722 | Hotel des Acacias. |
| Digne ..... | 42 | 764 | Hotel Boyer-Mistre, Boulevarde Gassendi |
| Castellane ..... | 54 | 818 | Hotel du Levant, Place de la Grave. |
| St. Vallier ..... | 52 | 870 | —— |
| Grasse ..... | 12 | 882 | Hotel Victoria, Av. Riou-Blanquet. |
| Cannes ..... | 18 | 900 | Innumerable hotels and "pensions." |

NOTE.—About 20 kilometres can be saved by taking the direct route from Bourg to Grenoble instead of passing through Aix-les-Bains and Chambéry. NOTE: One kilometre equals five-eighths of a mile approximately.)

**To the Riviera by Motor Cycle—**

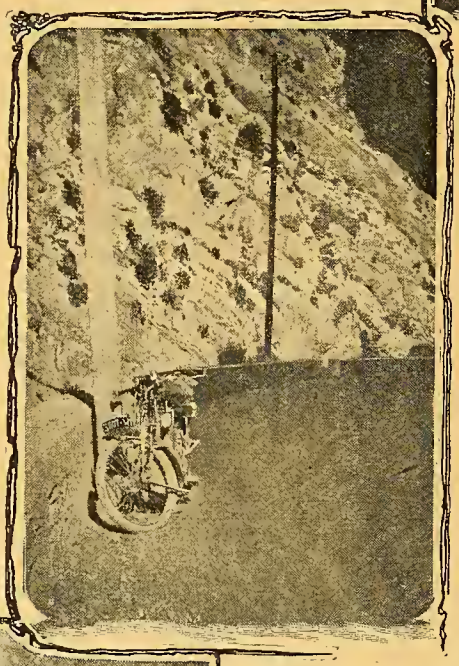
Having crossed the Rhône, we are in the French Alps and the Department of Savoie. Everyone has a special preference—very deep-rooted in the case of primitive peoples—for some particular part of this earth, natal soil in the majority of cases; but for me Savoie is the loveliest land in all the world. When autumn turns the vines to brilliant yellow and purple, and tall, slender poplars shine in the sun like pillars of gold against blue mountain backgrounds; or when snow leaves the heights in spring, and gentians and narcissus appear; then this country is a scene of living beauty, and the rich fertility and peace of the land are like the fulfilments of all one's desires.

### Lake and Mountain Scenery.

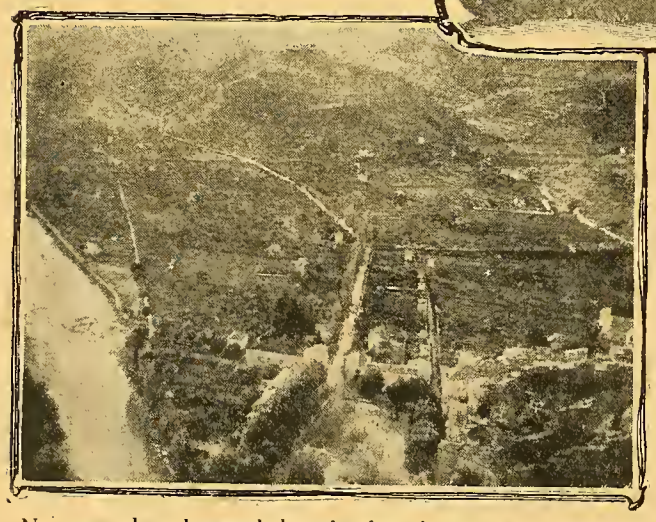
The Lac du Bourget, close along the east bank of which the road passes to Aix-les-Bains, is the largest lake in France, and Aix-les-Bains is undoubtedly one of the finest touring centres that can be found. The route through Chambéry to Grenoble down the right bank of the Isère is now in good condition, and includes no hills worth mentioning. Although the route here described has now traversed nearly 150 kilometres of mountain country through the Jura and the Alps, no long ascents have yet been met with, the climbing beginning in earnest only after Grenoble. From Bourg to Grenoble it may be noted that there is a shorter route available *via* Lagnieu, St. Genix, Les Echelles, and St. Laurent du Pont at the foot of the mountains of the Grande Chartreuse; but the route *via* Aix-les-Bains and Chambéry is recommended as being the better and more picturesque road, and either of these two towns are good places at which to stop for lunch.

If this journey is undertaken in mid-winter it is wise when passing Grenoble to inquire at the Syndicat d'Initiative, 2, rue Montorge, if the road is likely to be blocked by snow. The route followed and about to be described is kept open throughout the winter in so far as is possible, being only blocked for short periods after exceptional snowfalls. The highest pass, the Col de la Croix Haute, is less than 4,000ft. If, however, on arrival at Grenoble it is found that the road further on is impassable, there is nothing for it but to return to the Rhône valley at Valence and pursue the journey *via* Orange, Avignon, Salon, and Aix-en-Provence, a route that is about 100 kilometres longer and a hundred per cent. worse as regards road surfaces.

The bridge across the Durance at Sisteron, showing the remarkable vertical stratification of the walls of rock between which the river flows.



Between Digne and Barrème the road to the Riviera passes through a deep ravine.



Not an aeroplane photograph, but taken from the rock above Castellane on which stands the chapel of Notre Dame de la Roche.

Assuming that the mountain road is clear, we leave Grenoble by the fine avenue of the Route de Pont de Claix and bear to the right at this place, passing through Vif and Monestier de Clermont to the Col du Fau (2,925ft.), a long, well-graded rise through glorious scenery; but it is on passing the top of the Col du Fau that the most splendid view is seen on a clear day. The high Alps of Dauphiné lie to the left, the peaks of Mont Pelvoux and La Meije dazzling in everlasting snow, with a great tumble of lesser mountains and ravines in the middle distance.

### On the Heights

The winding, undulating road from the Col du Fau to the Col de la Croix Haute about thirty kilometres further on has all the beauties with which nature could endow it. Spinning along on my sturdy little A.J.S., it was hard to keep the attention fixed, and close attention is needed for this road. There were maple trees and other bright autumn foliage, shining after recent

the Riviera by Motor Cycle—

ins with every hue of warm colour against dark
id velvety pines and fantastic rocks towering into the
y on the right, and all the way on the left the
onderful view of the high snow mountains patched
ith sunshine and cloud.

The Col de la Croix Haute brought my second speed to use for the first time for any considerable distance, but the admirable little engine showed no signs excessive heating. The top of this pass is cold and mewhat forbidding, and the southern side is far more eak and less picturesque than the northern slope, as very often the case on Alpine ranges; but the road the southern side affords very good going, as it scends gradually and in long, straight stretches instead of the usual hairpin bends. One can always ake up time on this section of the route if desired.

### Wonderful Rock Formation.

This valley of the little river Beuch is one of the ast attractive of Alpine glens, and it is not until steron is reached that anything very remarkable is en. Sisteron is a wonderfully picturesque place built the confluence of the Beuch with the Durance. here the river passes through a natural gateway of pendous rocks. The town has but one very narrow reet, from which radiate upwards and downwards, right and to left, strange, dark, sinister-looking irways with sombre arches and unpleasing odours. he place is overshadowed by a mediæval fortress rched on the rock overhanging the right bank of the er. Travellers will find this town both interesting d hospitable.

From Sisteron to Digne the aspect of the country less rugged, and one begins to feel for the first time at this is really the South. There is an extra illiance in the light and a gentle, genial feeling in e air that comes as a surprise and a delight to the anger from the North. Twice during last autumn had occasion to pass this way, and the second time, ding my 2¾ h.p. A.J.S., the atmosphere was marllously clear and bright, and free from dust and flies. On the next section of the road, between Digne and Castellane, where there is some of the grandest scenery of the whole route, the setting of autumn sunshine and brilliant colour was splendid and beyond all description.

A minor pass has to be ascended before dropping down into Castellane. It is minor in that it does not rise above 3,000ft., but it is fairly steep, with many bends, and has been known to be blocked with snow when the Col de la Croix Haute, a hundred miles further north, has been clear. Near the top there is a piece of utterly wild and fantastic scenery of the kind that must have inspired Doré for his illustrations of Dante's "Inferno." The road passes through an arch in a spur of the mountain and skirts round a stupendous "devil's punch bowl," the walls of which are solid rock with scarcely a vestige of vegetation.

The descent into Castellane is distinctly dangerous for the unwary solo rider. The bends are deceptive, as is also the gradient, and if one fails to get round a hairpin there is nothing to prevent a plunge into the void, which would probably be the end, so far as earthly affairs are concerned. Castellane itself is a sleepy little place nestling in a fertile oasis in the heart of most wild and rugged mountains, under the shadow of a rock that rises vertically about 500ft. above the town, with a little chapel and a large statue of the Virgin Mary on top of it. The walk up to this little chapel of Notre Dame de la Roche is well worth the half hour that it takes.

### A Lonely and Dangerous Road.

Those who wish to go direct to Nice without touching Cannes would not pass through Castellane, but would turn to the left at Barrème and proceed through St. André, Puget-Théniers, and the valley of the Var, which route involves no climbing. The last stage of the journey from Castellane to Cannes *via* St. Vallier and Grasse is the wildest and most desolate part of the whole route. To be seriously *en panne* midway between Castellane and St. Vallier would be a most unpleasant predicament. Part of the road is hewn out

Above St. Vallier, the cold bleak summit of the last pass before dropping down into the Riviera.

**To the Riviera by Motor Cycle—**

of an almost vertical precipice, and the remarks already made about the desirability of avoiding a plunge into the void are equally applicable to this section of the route. About fifteen kilometres before St. Vallier the first glimpse of the Mediterranean may be seen on a clear day, just where the far distant Esterel Mountains jut out into its amazing blue; but from the top of the last ascent above St. Vallier one comes suddenly upon "the Riviera" spread out 3,000ft. below, a wealth of luxuriance washed by the wonderful Mediterranean blue. The contrast is great: one is cold, perhaps chilled to the marrow, and, descending, the scent of flowers comes up to meet one with ever-increasing warmth in the air.

The journey is nearly over now, and I have barely spoken of the behaviour of the sturdy little machine that carried me with bag and baggage. The object of these notes, however, is not to praise a good machine, but, instead of painting the lily, to sketch this long route in all its principal features. The qualities I sought in taking the machine were reliability, durability, ability to climb anything, and the minimum of labour in upkeep, speed being a secondary consideration. I did not believe that any French machine could fill the bill, even after seeing the last autumn Salon in Paris, and in my little A.J.S. I have all the qualities postulated and a fine turn of speed as well.

Descending through Grasse, the centre of the perfumery industry of France and a very pretty place as well, upon the Riviera at Cannes is like entering another world—palm trees and roses after stunted bushes and rugged rocks. My journey ended at the little village of La Napoule, at the foot of the Esterels.

# HINTS ON TRIALS RIDING.

## The Important Question of Riding Position, Tuning, and Clothing.

WITH the approach of spring many riders, who, during 1921, passed through their novitiate stage, will be thinking of entering some of the big competitions to make a bid for fame. To such the following brief hints may serve to reduce the likelihood of trouble or annoyance on the road. The great thing on a strenuous reliability trial is to keep fit and avoid over-fatigue in every way possible. "No trouble" is the best assurance against weariness, for it is surprising how quite a small hitch in the smooth working of things, such as some unimportant item on the machine constantly working loose and requiring readjustment, takes the stuffing out of one on a difficult day's riding.

Riding position is all important, and the least tiring position is calculated to be the one to which you are most used. Do not make the mistake, then, of altering the height of your handle-bars or monkeying with the position of your saddle during the final tuning. An alternative position for the feet affords relief, and the riding position should be such that the saddle can be relieved of all weight by the rider standing on the rests without having to pull on the bars in a backward direction.

### Detail Care and Kit.

Do not carry any superfluous kit. The keys belonging to the machine, a large shifting spanner, screwdriver, valve cap key, insulation tape, pliers, tyre levers, copper wire, etc., occupy the right-hand carrier-bag, while the other is left at liberty for the repair outfit, which should be very complete, spare plugs, tightly packed chain links, and spare nuts and bolts, and so on, this lot being tightly jammed with dusters in the hope that you may not have to disturb them. Carry a small shifting spanner and a small screwdriver in your overall pocket—or better still in a compartment of your haversack, which can also contain a duster and minute repair outfit. Roll your spare tube neatly in American cloth and strap it securely to some clean part of your machine, possibly in the rear wheel fork under your saddle. This is a thing you may want quickly, so do not use string, which you are sure to cut when the time comes, leaving yourself without the necessary means for attaching the discarded tube. String is best eschewed for all purposes, as straps give a better grip and are easily undone. If you carry a spare outer cover, therefore, strap it *under* the flapper bracket, using three or four short straps.

Do not postpone your final tuning till the day before the event. Fit your new tyres several days beforehand, and likewise make all other adjustments, attach all accessories—in fact, have the machine all ready just as you intend to ride in the competition fully a week before the event, so that you will have tested everything and given things time to settle before the trial takes place. If there are any nuts or bolts that insist on working loose, clean the threads thoroughly with petrol, thus removing all grease, and if after this they still work loose a little seccotine smeared on the thread will doubtless give the desired hold. Seccotine and insulation tape are good friends to every competition rider.

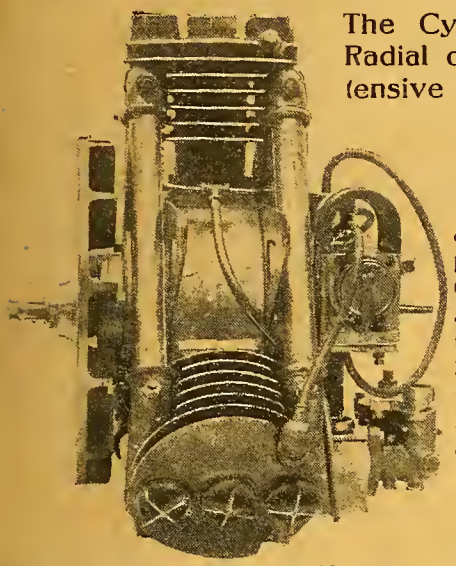
### Wheel and Head Bearings.

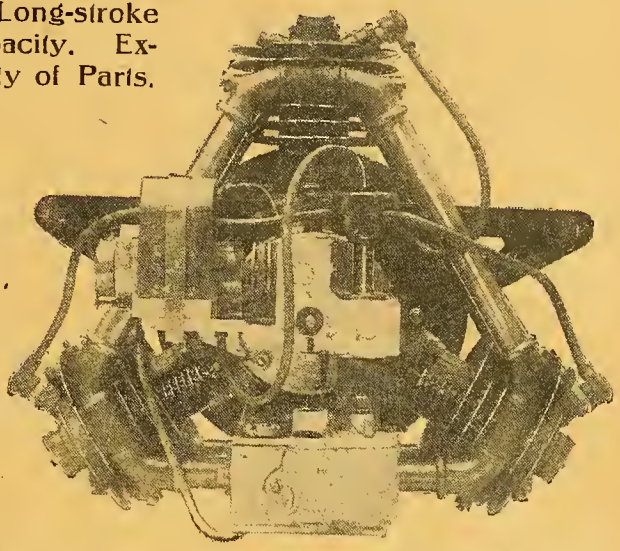
The present-day reliability trial generally affords a good deal of rough riding, and this year the roads are as rough as ever; therefore, look to your wheel bearings and particularly the steering head—slackness in the latter will affect the steering adversely, and may lead to frame breakages.

A variety of weather is always encountered during events of any length, and clothing is a problem. Generally it is intensely hot with bitterly cold storms on the hills, or baking one day and wet and chilly the next. To be over-clothed during the hot spells is almost as bad as being under-clothed during the cold spells, and the best plan is to carry a thoroughly warm waistcoat which can be stowed in a haversack when not wanted. One pair of hob-nailed boots and an alternative pair of gum boots make sure of one's feet, and a good soft woollen muffler is, of course, essential. It is a mistake to encase one's legs in cumbersome overalls, as over-clothing of this kind means that failure on a hill leads to violent perspiring, succeeded by chill during the open riding later. In my opinion, it is more dangerous to over-clothe for these really strenuous events than it is to err in the opposite direction, and one certainly need not clothe more heavily than for ordinary touring. CHINOOK.

# A THREE-CYLINDER ENGINE FOR CYCLE CARS.

## The Cyclone Unit, a Long-stroke Radial of 963 c.c. Capacity. Extensive Interchangeability of Parts.





Two views showing the clean and straightforward lines of the 7.5 h.p. Cyclone engine. It is about 22in. across the two lower cylinders and 20in. high. The end view shows that the width is no greater than that of a single or twin.

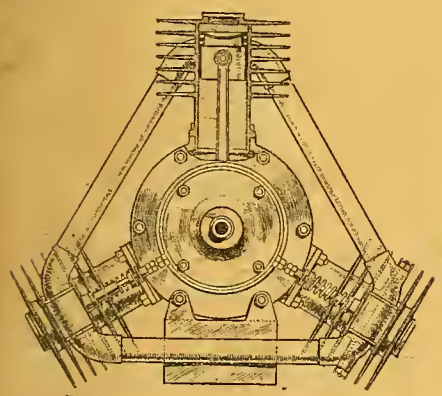
MANY claims for favourable consideration from designers and manufacturers are evinced by the radial type of engine—a fact more than once mentioned at some length in past issues of *The Motor Cycle*.

Up to the present only one designer has tackled the problem of evolving a commercially possible radial for motor cycle use, which, as a lightweight engine, was fully described in our pages. The same designer has now evolved a much more ambitious engine (still adhering to the three-cylinder layout), which, named the Cyclone, is being manufactured by the S.Y.S. Engineering Co., Ltd., Cyclone Works, Cardigan Road, Leeds.

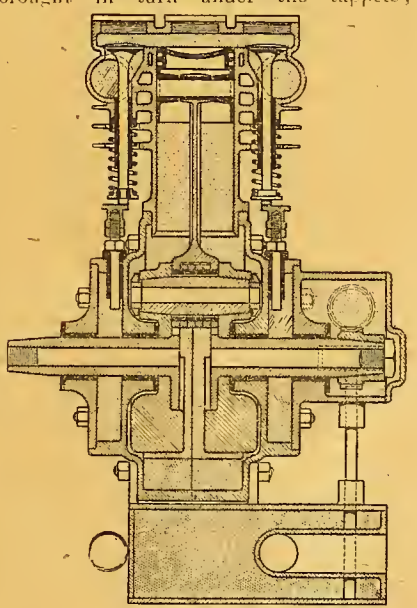
### Advantages of Radial "Threes."

Briefly to recapitulate the well-known points of the three-cylinder radial engine: It is compact, fairly light for a given capacity, and may be rendered very simple in construction. In a motor cycle frame it is easier to house than a flat twin; in a cycle car it is no more cumbersome than a V twin. In smoothness and continuity of torque it approaches the four-cylinder very closely, and in consequence enables a light transmission to be used with safety.

Turning now to the unit under review, the crank case, of aluminium, is in two symmetrical halves, and the cast iron cylinders (63.5×101.6 mm.) are held down on studs in the usual way. The combustion heads are of the T-shaped variety, and the cast iron pistons have deeply concave tops. Access to the valves is gained by means of valve caps, which are provided with cooling flanges, and a similar cap is arranged in the centre of each cylinder head. Cast integrally with the crank case sections are extensions which house the timing gears; these gears consist of a stationary internally toothed ring, a toothed wheel carrying four cams, and an eccentric mounted on the crankshaft. In its oscillations the eccentric causes the wheel to roll round the ring, and the cams are brought in turn under the tappets; obviously as there are four cams on the one wheel, this must revolve only once to eight revolutions of the engine crankshaft.



Section and general arrangement drawing of the Cyclone three-cylinder radial engine; the simplification of parts and the symmetrical arrangement on each side of the central line are noteworthy

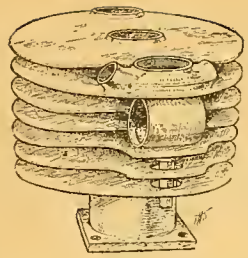


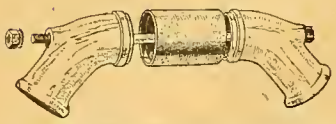
Each timing case is enclosed by a cover, and the crankshaft runs on plain bearings, four in all, pressed into these covers and into the crank case itself. Symmetry of parts on either side of the centre line of the engine is followed in the crankshaft, which is a massive assembly. The shafts are secured by flanges and studs to heavy discs, which incorporate the balance weights. One plain floating bush is used common to the three big ends, two of which are forked. Lubrication is effected by a gear pump in a separate sump, oil being delivered by a branched lead to both timing gears, from which it works along the main bushes to the crank webs, where it is collected in annular recesses and passes through holes which open on to the cheeks of the big end.

### Accessibility of External Fittings.

The tappets, which are adjustable, pass out of the timing case by way of bronze guides, and the same material is also used for the valve guides. Split collars in recesses on the valve stems are used to retain the spring cups. Although the appearance of radial engines is often marred by masses of external pipe work, the exhaust and inlet connections of the Cyclone engine are particularly neat. Here again all the pipe work is symmetrical on both sides. Projecting slightly from each valve pocket is a transverse tubular portion of the cylinder casting. Pulled into this by a single central bolt are two angle lugs into which the pipes are secured.

One timing cover has an extension, housing a worm-driven transverse shaft which drives the magneto at threequarters engine speed; incidentally, the magneto is of the single-cylinder type with two contact breaker cams, sparking twice per revolution. From the transverse shaft is also driven by worm a vertical shaft at half engine speed. On the top of this is the high-tension distributer, and below, in the sump, the oil pump.





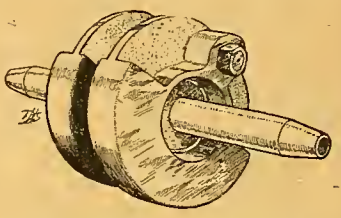
The cylinder has seven cooling flanges of enormous area in relation to the bore. Below is shown the method of securing the induction and exhaust pipework.

A noticeable feature of the engine is the remarkably cool running, due both to the vaned flywheel and to the enormous cooling area of the seven ribs on the cylinder; the valve chests are also well separated from the cylinder barrels. Such a wide stroke-bore ratio as that found in the Cyclone engine is unusual in motor cycle engine practice, 1 : 1.26 being an extreme in so-called long stroke engines, yet the ratio in the Cyclone is 1 : 1.6.

### Ample Speed and Power.

On the test bench we observed an engine working, and noticed that its range of smooth running varied between about 600 and something well over 3,000 r.p.m. (the rev. counter did not register beyond the latter figure); while on the road in a light cycle car we found that the speed obtainable was extremely high. No speedometer was fitted, but the speeds attained were certainly as high as those with which we are familiar on a certain make of cycle car noted for high touring speeds.

Very simple holding-down arrangements only are needed to secure the unit, a pair of triangular plates being held at each side by two of the crank case bolts, and the engine can thus be housed in a cycle car chassis or motor cycle frame with ease.



Showing the simple and sturdy construction of the crankshaft assembly and balance weights of the Cyclone unit.

# AN AVERAGE SPEED INDICATOR.

## The Possibility of Constructing an Instrument for Direct Indication of Average Speed.

THE speedometer is a very fascinating instrument. It advises the rider at a glance of the speed at which he is travelling and the mileage he has covered. But I feel sure many will agree that, if the instrument indicated the average speed instead of purely a velocity, we should not only find it more useful, but should derive from it a pleasure of much more permanent character.

For instance, it would give us great satisfaction to know the average speed at the end of a day's run. Or, in a reliability trial, anyone armed with this instrument could not fail to come in within the scheduled time.

### Is it Possible?

Having broadly indicated its sphere of utility, we will investigate the possibility of constructing such an instrument.

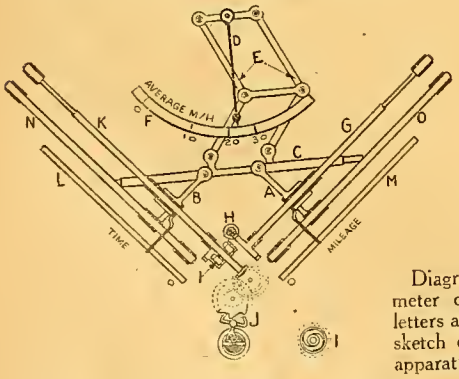
Bearing in mind that the average speed is equal to the ratio of total mileage to total time, the question merely resolves itself into either one of two things—a simple type of dividing machine or subtracting machine on the logarithmic proportion. However, the former type of machine seems to lend itself for this particular application.

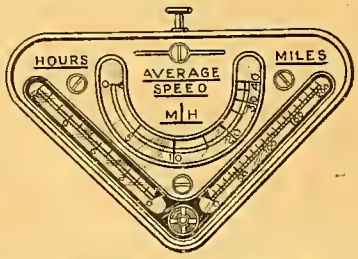
It is well known that in a right-angle triangle the height divided by the base is numerically equal to the tangent of included angle between the base and the hypotenuse; then, if the base represents mileage and perpendicular time, the average speed is equal to the ratio between the two factors. Therefore, it follows that the average speed is directly proportional to the tangent of the included angle.

An instrument so constructed is shown diagrammatically in the accompanying drawing, and the sketch represents the probable appearance of the finished article produced commercially.

### The Device Described.

Referring to the drawing, it will be observed that a direct application of the principle previously described is made. So that if the arm A progresses according to the mileage covered, and the arm B advances at a constant speed, we are able to reproduce a condition comparable to that of a height and base in a right-angle triangle. Further, by introducing the sliding beam C connected to both arms, we get the effect of having the remaining component, namely, the hypotenuse. Since it was found that the slope of hypotenuse with respect to its base is directly proportional to the average speed, we proceed to transmit the movement of the beam C to the pointer D by means of a series of links E, which are so arranged as to produce a parallel motion, and an addition of a suitable scale F enables a direct reading of average speed in miles per hour to be made.





Diagrammatic arrangement of the average speed meter described in the accompanying article; the letters are referred to in the text. An imaginative sketch of the external appearance of the proposed apparatus is also shown above.

### Mechanical Features.

It will be seen that the arm A is propelled by the action of a screw thread G, which is driven by a worm H, and the same method of propulsion is applied to the arm B. But, in order to obtain a constant rate of progression, a friction drive I and an escapement mechanism J, similar to that of a watch, are interposed between the worm drive H and the screw thread K.

The pointers attached to the arms A and B indicate, in conjunction with the respective scales L and M, the magnitude of both time and mileage independently of the average speed.

The letters N and O in the drawing signify arm-supporting members.

NOALL.

[An average speed meter, the invention of Dr. A. M. Low, was about to be produced commercially in 1914 immediately prior to the war.—ED.]

## BIRMINGHAM CLUB'S SPORTING TRIAL.

RESULTS of the Birmingham M.C.C. sporting half-day trial, described last week, are now to hand, and are as follows:

SILVER CUPS FOR BEST PERFORMANCES.—Solo: B. H. Riley (2¾ A.J.S.). Sidecar: H. S. Perry (6 B.S.A. sc.).

GOLD MEDALS.—G. F. Barrett (2¾ T.B.), A. Thrush (3½ Sunbeam), D. Brandish (4 Triumph), G. Butcher (3½ Sunbeam), A. Watson (3½ Sunbeam sc.), T. H. Walker (6 B.S.A. sc.), and H. V. Collins (3½ Norton sc.).

SILVER MEDALS.—B. Kershaw (2¾ New Imperial), T. Wooley (2¼ Sun-Vitesse), G. C. Jenkins (4¼ B.S.A. sc.), and B. L. Bird (6 B.S.A. sc.).

BRONZE MEDAL.—K. G. Uzzel (8 New Imperial sc.).

# WELDLESS STEEL TUBING.

## The Use of High Carbon Steel and Tapered Lugs.

IN the last issue of *The Motor Cycle* we referred briefly to a paper read before the Institution of Automobile Engineers by Mr. W. W. Hackett. So interesting and important were its contents that we make no apologies for reprinting extracts which should be of the greatest value to manufacturers.

The author referred to a series of failures caused by unsuitable lugs. The chief fault of some of those used in the earlier days of the motor cycle industry was that the outlets were too strong, and case after case of tube failure occurred, tubes often breaking off so cleanly as to give the appearance of having been cut through. As the broken tubes could be flattened, it was provable that they were in a ductile, and not brittle, condition, and a series of tests was carried out in order to prove that the fault lay in the excessive strength of the lug outlets. A lug having strong outlets was taken, and one outlet only was tapered off. A piece of tubing of usual size and quality was brazed into the lug, the lug then being firmly secured to a plate. The ends of the tube were then moved by an eccentric and connecting rods, giving a half-inch movement to each end at a speed of about 400 r.p.m. Each time the experiment was tried the tube broke off cleanly close to the thick outlet, whereas it was always intact at the tapered outlet.

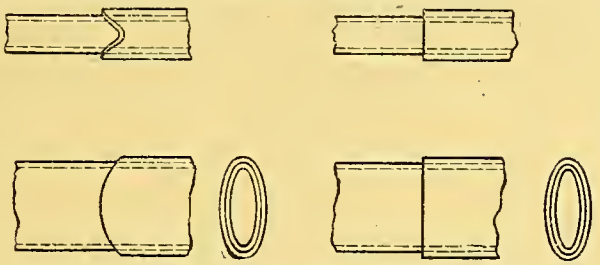
In another test, two tubes brazed into lugs with a thick and the other with a tapered outlet were held rigidly by the lugs, and similar weights were applied at the ends. The tube brazed into the lug with tapered outlet bent with an easy curve, but that brazed into the lug with a strong outlet bent abruptly close to the lug.

Alternating stress tests were also carried out on a number of tubes held in grips, half of which had tapered outlets and the others strong outlets. When the taper grip was used the average number of revolutions before breakage occurred was 248,371, but when the strong outlet was used, breakage occurred after only 120,545 revolutions, or less than half the number experienced in the case of tapered outlets. Another interesting feature of the same test was the spiral form of the break of the tubes held in taper grips, which seems to prove that the fatigue is shared over a large area, as this form of break never occurred when the tube was held in grips with strong outlets, the fractures being distinctly localised.

### Strength by Tapering.

Quite a number of running tests on front forks of various tapers were carried out, reducing to what may be thought to be ridiculously small diameters at the bottom of the fork, but the life of the fork increased as the size at the bottom diminished. In many cases weight can be saved and increased strength can be given by a tapering of the tube in diameter or in the gauge.

On motor cycle frames it is possible to decrease the weight of the tubes greatly by a proper distribution of the strength. The motor cycle manufacturer knows at which part of the frame breakage occurs. In many instances the front down tube has been the vital part, and the break has occurred close to the top lug. It is much better to put in a taper gauge tube to prevent the trouble than merely to increase the gauge. If a 12 gauge down tube has previously been used, a tube of the same weight, but tapered from 10 to 14 gauge in its entire length, will, no doubt, remedy the defect. The tube is stronger because of its added thickness at the critical point, and also because the tapered gauge enables the fatigue to be carried away from the lug. A 12 to 15 gauge or a 12 to 14 tapered gauge would be stronger than the 12 gauge plain tube.



The curved outlets on the left are suggested as being stronger and more suitable than the usual square type.

The lugs should be kept as light as possible at the outlets, and a lug with a curved shape at the outlet is better than one with the square cut outlet generally used.

### High Carbon Steels.

From experiments carried out during the war period on aeroplane tubing, it was found that excellent results could be obtained by using 0.5% carbon steel tubing, giving in the bright or blued state a yield of 40 to 45 tons per sq. in., and an ultimate stress of 45 to 50 tons per sq. in. When annealed, the steel should give 23 tons per sq. in. yield, and 35 tons per sq. in. ultimate. The author found, however, that in the motor trade there was no inclination to use these high carbon steel tubes, and opinions were expressed that the tubing from this steel would of necessity be brittle. Whilst it is recommended that care should be taken with the heat-treatment, the whole of the author's testing has been carried out on joints brazed in his shops in a commercial manner, with no more care taken than in ordinary production. Although hundreds of tests have been carried out, he has not had a contradictory result; 0.3% carbon tubing has always been better than 0.15%, and 0.5% always superior to 0.3%; 1in.×20g. high carbon steel is much stronger than the 1in.×18g. medium carbon steel. Again the 1in.×20g. high carbon steel is as strong as the 1in.×17g. medium carbon steel, and much stronger than the 1in.×17g. low carbon steel; 1in.×18g. carbon steel is as strong as the 1in.×16g. medium carbon steel, and 1in.×20g. high carbon steel is much stronger than the 1in.×16g. low carbon steel. Also, it has been found that the 1in.×20g. high carbon steel is as strong as 1in.×15g. low carbon steel.

Other tests have been carried out on this question of the value of steels containing varying percentages of carbon when brazed, and all the results have proved unquestionably that by using a 0.5% carbon steel a greater strength can be obtained with a less weight than by using a low carbon steel.

### Greater Elastic Limits.

High carbon steel tubing of 1in.×20g. is practically as strong as 1in.×15g. low carbon steel, yet it is only one-half as thick. This, of course, is owing to the fact that after undergoing the brazing process the elastic limit of a 0.5% carbon steel is about twice as high as that of a 0.15% carbon steel at the brazed joint, and consequently the high carbon steel is able to stand much more stress than a low carbon steel.

The author has found in the past great opposition to the use of high carbon steel tubing, and it has been urged that such tubing must of necessity be brittle. This is not so; in the bright state almost as good flattening results can be obtained as with the low carbon steel.

It is not suggested that only high carbon steel be used, as where the low carbon tube has proved satisfactory, there is no need to go to the added expense of the higher quality material, but if motor cycle designers will look back a few years, recall the increasing weight of the machine caused by substituting tubes of a heavier gauge for those that have failed, and try a higher carbon steel instead, a lighter, stronger, and more resilient machine will be the result.

There is one other point. It is always possible for steel supplies to be received in a mixed condition. The tube maker may get some wrong billet from the steel maker, or mistakes may occur in transit or in the tube works. There is also a chance that the motor cycle maker may mix qualities in his stores. If any test is to be made to check the carbon contents on commercial lines, that test must be a cheap one. The "spark test" for carbon is a quick method, and, in the hands of a capable and properly trained man, the percentage of carbon in the steel can be determined to within 0.25%. The author is indebted to Messrs. Hans Renold, Ltd., for his knowledge of this.

When a piece of steel is pressed against a grinding wheel, a shower of sparks is produced, and this shower may be called the "spark-sheaf." The spark-sheaf consists of spark rays, or lines of light produced by the flight of the sparks, and spark pictures, which are small explosions appearing along the spark rays. It is from the spark pictures that the percentage is estimated, since the brighter and more numerous the spark pictures the higher the carbon content.

BI

# A Motor Cycle Holiday in London

As at St. Mark's, Venice, the pigeons at St. Paul's are so tame that they will feed out of the hands of the stranger.

## The Metropolis as seen by a Provincial Motor Cyclist.

IT is a trite saying that the average Londoner knows less about London than most provincial visitors, but it is probably true that the majority of London motor cyclists know and appreciate its many charms. Nevertheless, it is the visitor to the Metropolis on a sight-seeing expedition who learns more of the world's largest city than most of those who are daily within sound of Bow Bells, for one seldom appreciates that which is near at hand.

Hundreds of provincial motor cyclists annually visit London, but even after many visits, they seldom know more of London than is bounded by Olympia and the West End, while those who have to cross London *en route* from one part of the country to another usually consult maps and guides as to the most convenient way of avoiding the heart of it, always having in mind a dread of London traffic which is immediately dissipated once the streets have been negotiated.

### Imaginary Terrors of Traffic Driving.

Ask almost any provincial motor cyclist his opinion of a motor cycle holiday in London, and one receives an exclamation of surprise, if not of derision; yet to drive in London streets is far easier than in many a country market town. Given a modern machine with a tractable engine and a smooth hand-operated clutch, no provincial motor cyclist need hesitate about spending a holiday awheel in the heart of the British Empire.

True, such a holiday will be entirely different from a tour or a stay at a seaside resort; it will not be so restful perhaps, but for the energetic sightseer London has no compeer. It abounds in interesting show-places, which form the key to history and to the development of our great country.

The business man visiting the Metropolis who, with an evening to spare, takes a trip on the top of a 'bus may think that he is seeing London, but he is only obtaining a superficial glance, and, while the Fleet Street journalist who takes a short cut through the Temple may "feel" the atmosphere of this quaint and peaceful corner of a hurly-burly world, he rarely troubles to investigate the fund of interest there is within a yard or so on either hand. No, one cannot obtain a proper idea of London, its beauty, its romance, and its interest by hurrying on as a passer-by, neither are all the places which are worth visiting on the lists of amusements or museums, nor are they depicted on picture postcards or otherwise advertised.

Having spent fourteen whole days exploring the Metropolis with a motor cycle and a further fourteen evenings afoot, the writer—a provincial motor cyclist—has decided that a month is barely sufficient to exhaust the recognised show places alone.

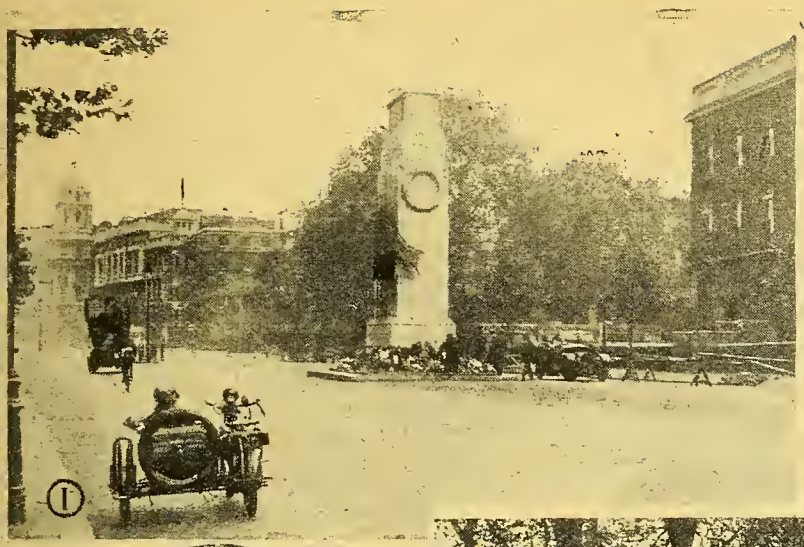
### All London Available.

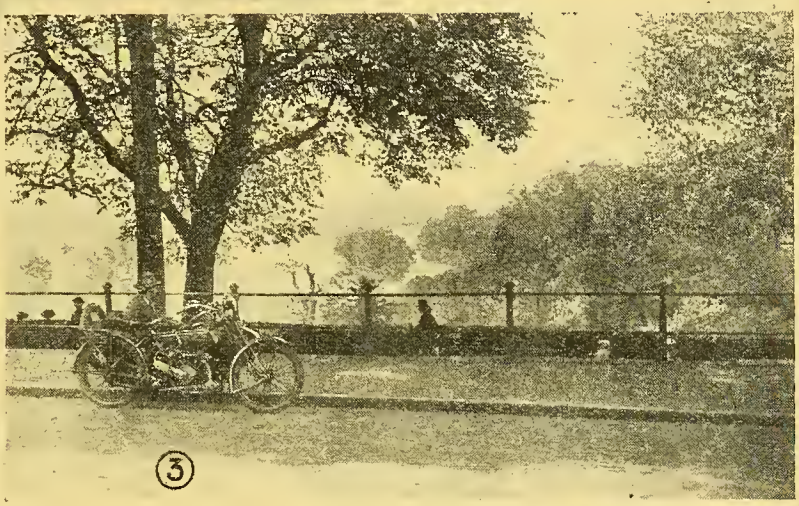
But it is not everyone who wishes to explore museums and the tombs of our famous dead. Nevertheless, any motor cyclist holidaying in London owes it to himself to see Westminster Abbey, St. Paul's, and the Tower of London; the rest may be missed, if desired, for a half-day in the Abbey alone will be sufficient to convince him that London deserves the honour paid to it by the whole world.

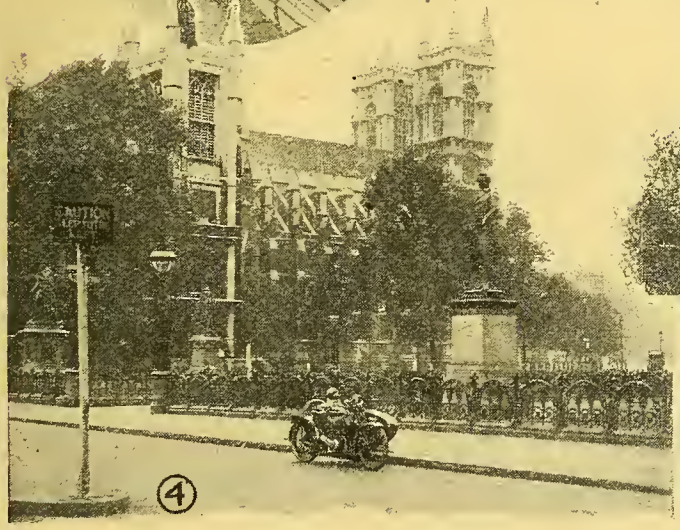
During the holiday referred to, a sidecar outfit was used every day. Accommodation was found in West Kensington, and the machine was garaged at a mews at the end of Russell Road, which is opposite the Addison Road entrance to Olympia, with the railway in between.

# PHOTOGRAPHIC REMINISCENCES OF A MOTOR CYCLE HOLIDAY IN LONDON.

All the metropolis is not a seething mass of traffic, as is usually supposed by the provincial. It is within the City of London itself that the streets are most crowded, but in the City of Westminster there is room for the motor cyclist sightseer. It is this part of London that contains the show places so beloved by the visitor.







(1) The Cenotaph in Whitehall, where many Government buildings are situated.

(2 and 3) On the Terrace at Richmond—one of the beauty spots of Greater London, but where the police are not sympathetic to sightseers on wheels, and do not allow the motor cyclist to stand for long in order to admire the view.

(4) Westminster Abbey, often overlooked by the passing motor cyclist, whose eyes are attracted by the imposing Houses of Parliament on the other side of the street.

(5) Sunday morning on the Embankment; on week days this fine road is a taxi drivers' "T.T." course. Cleopatra's Needle is seen on the left

**A Motor Cycle Holiday in London—**

This is about as near to the most interesting parts of London as it is possible to obtain garage accommodation—for the garaging difficulty is very acute, and any stranger arriving at, say, the Marble Arch, Piccadilly Circus, or Trafalgar Square would find it difficult to find lodging for his machine. But for this, an hotel near the Embankment or in the Russell Square district would have been preferred. However, West Kensington was found to be quite convenient as a centre not only for London itself, but for the surrounding suburbs which were explored in turn—and, in many cases, with disappointment. Golder's Green, for example, so Continental at first sight, seemed but a community of dolls' houses, and most other suburbs known by name to the provincial disproved the popular fallacy that London is a superior place in every way.

### Greater London.

London stretches out its suburban lines of railways and tubes, and almost any suburb within these areas compares unfavourably with the residential districts of most large cities. There are exceptions, of course, Richmond, for instance, would be exceptionally nice if it were not for the trippers who reduce it to a somewhat cheap resort on Saturdays and Sundays. Notwithstanding, it is well worth a visit—on any other day—for the view from the Terrace across the twining Thames is superb. Taken on the whole, however, London has not much to offer to the provincial in the way of scenery, especially if the visitor be from such beautiful counties as Warwickshire or Gloucestershire, and the lack of hills worries those from further North.

Southward of Croydon, in the Weybridge district or on the Surrey Downs, there is much to interest the motor cyclist in search of beauty, but it is in London itself that the greatest charm lies, and after these trips to the outside this fact was borne upon the writer every time.

A motorist since the beginning of motoring, the writer on this holiday discovered the most uninteresting route he has ever traversed. This was from the Metropolis to Southend-on-Sea *via* Ilford. If it is possible to find a more dull forty miles then it is from Southend-on-Sea to London *via* Grays.

The journey was undertaken on a Sunday, when life on the Commercial Road could be studied at its best. Anyone undertaking the trip should first read "Limehouse Nights," and, on his trip through Whitechapel, he will see all the characters Thomas Burke has sketched in his stories.

### Open Spaces—Within and Without.

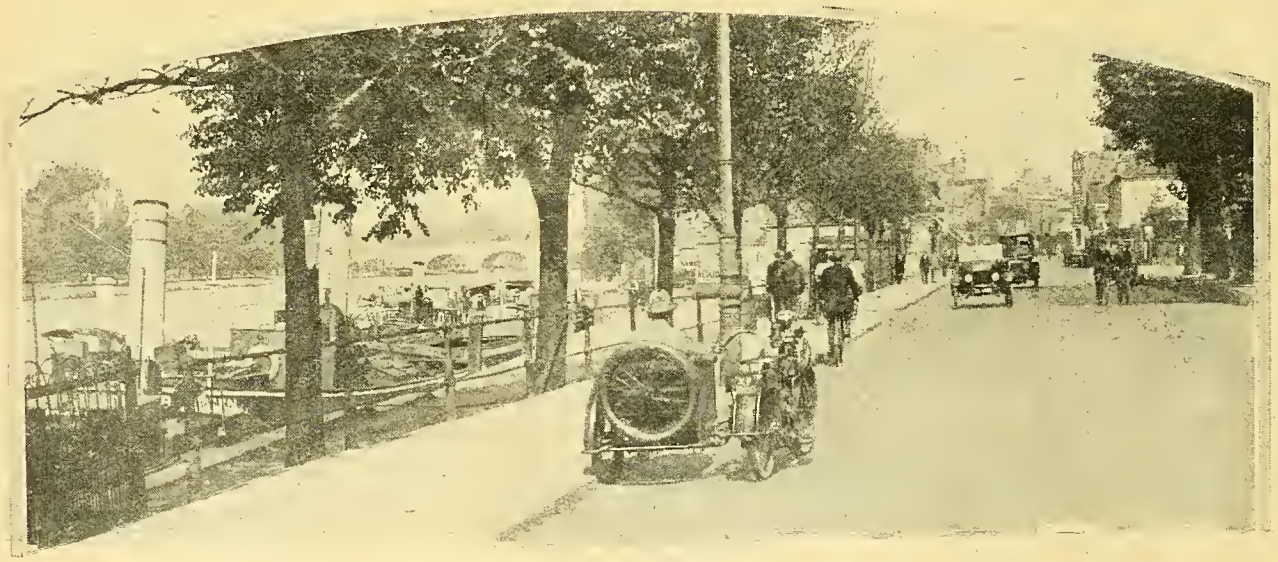
These outside trips may not be so interesting as the exploration of Hyde Park, the Green Park, Kensington Gardens, The Mall, or the Embankment, but it is impossible to grasp fully the atmosphere of London without knowing to what it forms the centre.

Advantage was taken of an opportunity of seeing Brooklands, with the result that all preconceived ideas of the track were changed. The provincial motor cyclist who has never visited the famous racecourse at Brooklands should make a point of doing so.

Altogether, it was a most interesting holiday, and one which helped each member of the party better to appreciate why London cannot be compared with any other city in the kingdom.

Not least among the interests for the driver was the negotiation of London traffic. First impressions are that all vehicles are driven too fast, but so well regulated is the stream, and so well understood the rules of the road, that speeds which would be most dangerous in provincial cities are quite safe. One thing is certain, if every motorist spent a week every year in London with his machine, he would be a better driver when in the provinces, for there the policeman must be obeyed, and it is inviting police action, with probably severe results, to deviate from the cast iron rule that all traffic passes to the left of the "refuges" in the centre of the roads

The same sentiment applies also to policemen, for it is certain that if the police of the provinces served an apprenticeship in the Metropolis, traffic regulation would be greatly improved. As for London policemen themselves, there is not a more courteous and patient body of men in any sphere of life.



Alongside the Thames at Kingston—one of the several interesting resorts to be visited during a motor cycle holiday in London

# LETTERS to the EDITOR.

The Editor does not hold himself responsible for the opinions of his correspondents.
Correspondence should be addressed to the Editor, "The Motor Cycle," Dorset House, Tudor St., E.C.4, and must be accompanied by the writer's name and address

### *MAXIMUM SPEEDS OF TWO-STROKES.*

Sir,—I have a Revere-Villiers, and can do 40-45 m.p.h. on a 5½ to 1 gear, 25 jet, Shell spirit, and Speedwell oil. Recently I came from Coventry to Leicester, *via* Bedworth and Sharnford, nearly thirty miles, in one hour, and the engine was as cool at the finish as at the start. I may say that my machine is a 1915-16 model. AY 4417.
Leicester.

Sir,—I was interested in "Kelly's" letter in *The Motor Cycle* of December 15th, 1921. Something must have been wrong with his Velocette if it would not do more than 38 m.p.h. and 120 m.p.g. I have a 1920 Velocette two-stroke, and I can do 45 m.p.h. and 140 m.p.g.

If 38 m.p.h. gets on his nerves, I should like him to do about thirty miles on my Velocette with it wide open. No, it would not overheat, although 2¼ h.p. two-strokes may be called 2⅛ h.p. Tink-a-Ponks. I get there every time. I shall be tuning it again soon, and hope to attain 50 m.p.h. by Cowey speedometer.

Could anyone put forth the proper pronunciation of Velocette? I have heard four different ways.
Banbury. WE TWO.

Sir,—I am rather interested in the letter of one of your corespondents ("AR 8414"), who says that the maximum speed of his Villiers-engined Revere is not more than 38 m.p.h. I have one of these machines, a 1920 model with Amac carburetter (jet 24) and a Sturmey-Archer two-speed gear, and have obtained just over 40 m.p.h. on the level. If the machine belonging to your correspondent has a Sturmey-Archer, I think he may find that his clutch is slipping, as this trouble has occurred with mine. To remedy this, take off the cover held by three small nuts, and then it may be found that the large nut inside has worked loose.
Nottingham. C.W.B.

### *GEAR CHANGE DIFFICULTIES WITH A SLIDING PINION BOX.*

Sir,—It would be interesting to know whether any riders of 3½ h.p. three-speed Rover motor cycles have experienced difficulty in the gear and clutch control of their machines.

I ride a 1920 model solo, with standard gears, and find it quite awkward to change up when starting, as it is quite easy to miss the second gear position.

Changing down is also rather awkward, and the engine seems to race wildly, although the throttle is greatly reduced. It seems that there is too much of a drop in the ratio.

The clutch control being by foot is, of course, rather awkward for solo work, but is otherwise well up to its work.
S. TOURRER.

### *THE WORLD'S BEST ROADS.*

Sir,—For some months the continual grumble anent our roads has raised my ire (I know to grouse is the greatest joy of every Englishman, but if only he realised that this continual belittling of his country is taken for the truth abroad he might cease; why not a little American "world's best"?), and "Overseas Triumph" puts the lid on it. I should like to inform him that from the many enquiries I have made, I have drawn the correct conclusion, I think, that England has easily the world's best roads, and, above all, how beautifully Tarmacced are all, practically speaking, of our small roads.

With regard to the last part of his letter, may I put one question? What happens when it rains? Having lived in France now for two years, and done some 8,000 miles there, I should like to say that the answer to the above question, coupled with ever such a small amount of traffic, gives a result absolutely unknown in England for "appallingness."

In conclusion, I am compelled to make what may seem rather a sweeping statement, but in four months spent in England last summer, and every minute possible in the saddle, I never saw a bad road, and never either hit or saw a single pot-hole worthy of the name. (This applies only to the country south of Norfolk, as I did not go further North.)
H. BEACON.

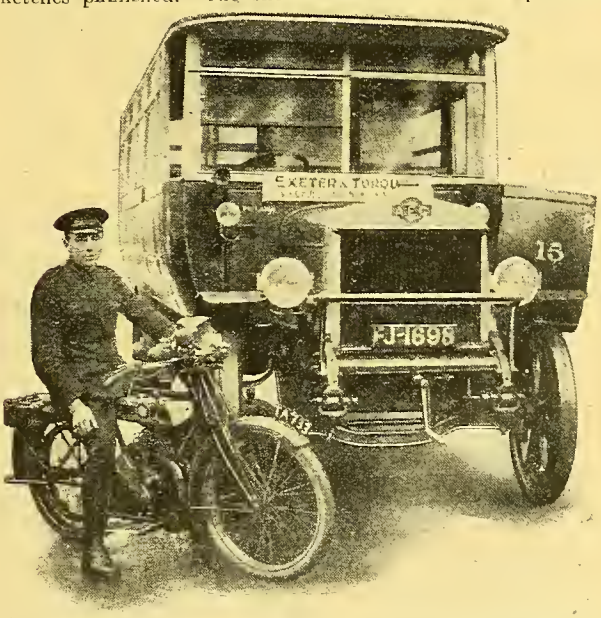
### *HEAD LAMP DIMMING.*

Sir,—I would like to take the opportunity of replying to your corrrespondent Mr. Ernest Wm. Troughton in your issue of December 29th in order to defend the "Inter-departmental Lights on Vehicles Committee."

I am not in any way connected with the committee, but, nevertheless, one feels that your correspondent's letter, in spite of its inaccuracies, is liable to give motor cyclists and others the erroneous impression that the Americans have really produced an efficient anti-dazzle lamp which does not reduce the intensity of the light beam whereas our committee has failed.

This, however, is most decidedly not the case; and, furthermore, the statement of the English committee is essentially correct at this date, namely, that "it is not possible to eliminate dazzle (in motor car lights) and at the same time leave an adequate driving light."

I would first of all like to draw your attention to the sketches published. The one on the left shows the parallel



An inspector employed by the Devon General Omnibus and Touring Co., Ltd., for checking passengers' tickets on 'bus routes, and generally acting as despatch rider for the company's manager. The work is strenuous, as it means being out every day all the year round on South Devon roads and much cross-country work when cutting across from one route to another. The machine is a P. and S. two-stroke, and during the first month on service the inspector covered 1,400 miles, in the second the monthly mileage went up to 1,600, and the third to 1,800.

beam emerging from the prism in a manner and direction which is utterly impossible for it to achieve. This point is unimportant, except that it shows the inventor to be insufficiently acquainted with his subject. The sketch upon the right hand is even in a worse condition. If the front prism is composed of a number of lenticular cylindrical strips, then the parallel beam from inside the lamp would be thrown to a series of foci parallel to, about 2in. or so in front of, the lamp, in which case the beam is no longer parallel (as shown), but divergent in a horizontal plane and weakened in intensity inversely as the square of the distance from the lamp.

Secondly, I would suggest that if the only function of the prism is to deflect the rays on to the ground, why have it at all? Why not tilt the lamp downwards?

Thirdly, your correspondent's statement that this device (or any other device) can "give, without loss of light, wide depression and no glare" is incorrect, and in contradiction to the most elementary laws of optics.

Fourthly, if your correspondent is correct when he states that "this lamp gives a beam 50ft. wide at 100ft. distance from the lamp, and of sufficient intensity to make riding possible," then the candle-power of the head light must be enormous; because one must remember that without this device, and using a 6in. diameter lamp with an electric filament $\frac{1}{8}$in. long and about $\frac{1}{100}$in. in thickness and parabolic reflector about 1in. focus, the size of the projected filament, when the rays are parallel, will be about 13ft. high and 1ft. broad at a distance of 100ft. from the lamp, and now, if one places the device in position, this patch of light (13ft. × 1ft.) is drawn out 50ft. in a horizontal plane, so that the intensity of the patch has now been reduced to one-fiftieth of its original value! Surely this is a reduction in intensity.

The elimination of glare without loss of light cannot depend upon deflections, deviations, dispersions, or diffusion, and it is surprising that people have endeavoured, and are still endeavouring, to solve the problem upon these lines and through these agencies. ROVER.

London, N.19.

### *SUPER SPORTS MODELS ON THE ROAD.*

Sir,—I was intensely interested in your report of your road test of the four-valve Triumph in the issue of *The Motor Cycle* for December 29th, 1921, more especially as I am the proud owner of a rival 1922 sports model—to wit, the long-stroke T.T. Sunbeam. My machine is one of the two Show models, and, although a side-valve engine is used, this is, of course, super-efficient; and, after reading your remarks on the road performance of the Triumph, it is easy to see that my engine has many features in common with this. For instance, my engine is also very sensitive to ignition variations, and here, again, the top gear is high—4.1 to 1—and consequently one potters through busy thoroughfares on the second gear of 6 to 1, and should accelerate to at least 30 m.p.h. before changing up!—that is, if the engine is to be humoured as such a fine specimen thoroughly deserves to be.

The "slap" of the aluminium piston is very apparent unless the revs. be kept up, more so than in the case of the 85×88 mm. sports Sunbeam engine which I owned last summer. The extra resonance of the deeply finned cylinder and the hefty punch behind the 5.9 to 1 compression ratio are probably chiefly accountable for this increased noise. The acceleration of this engine, however, can only be described as *extraordinary*, and, worst of all, there is no carrier to fall back on to if the throttle be opened too suddenly!

Amersham. HARMONY.

### *72 M.P.H. ON A PRE-WAR SINGLE.*

Sir,—With reference to "Old 'Un's" claim to do 72 m.p.h. on a pre-war Triumph. I do not claim to do anything like this speed, but, being a sportsman and a good loser, I am prepared to take him on. If he wins, I will make him a present of my machine, which is a 1920 8 h.p. sporting Zenith, fully equipped. L. MAYNARD.

### *WHICH IS THE WORLD'S CLEANEST MOTOR CYCLE?*

Sir,—I have read with very much interest in recent issues of your paper the correspondence in connection with the query as to which is the "world's best motor cycle," and, although this raised some very interesting points, in my opinion there is still another point to be considered in this connection, and I should like to know from your readers which they consider to be "the world's cleanest motor cycle" to ride.

After many years of considerable experience in riding different makes of machines, for the past twelve months I have been riding a Matchless Model H2 sidecar outfit, and, without fear of contradiction, I consider this to be absolutely *the* machine for cleanliness.

It may interest you to know that, day in and day out, I ride this machine up to business and home every day, wet or fine, without the use of any overalls whatsoever, and I still have to learn of another machine which will permit this.

I can only conclude by giving a slogan: "Matchless is matchless for cleanliness." W. PRATT.

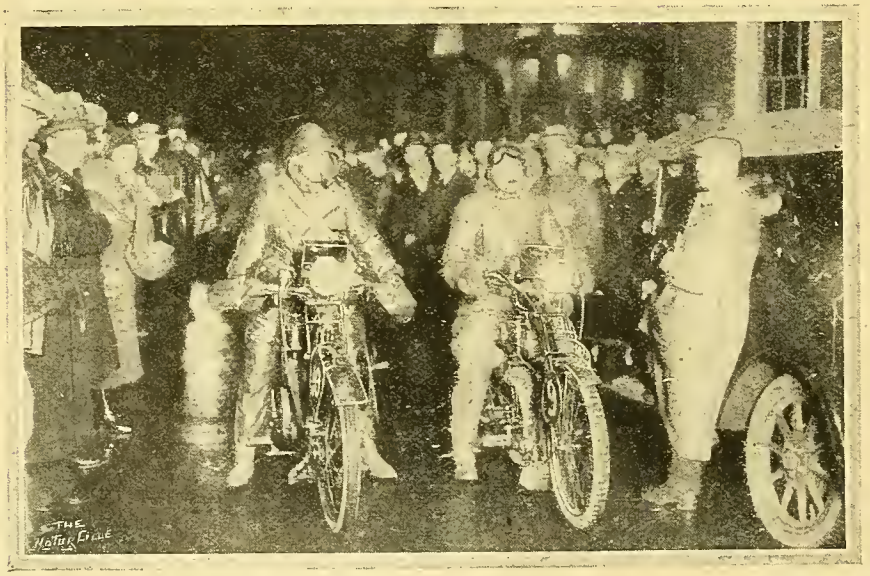
### *WATER POWER FOR LUCAS DYNAMO.*

Sir,—"H.M.B." seeks information *re* house lighting from a Lucas dynamo. It should be quite feasible to drive this dynamo by means of a water motor. The ideal arrangement would be to direct-couple the turbine to the dynamo by means of a flexible coupling.

DATA.—Assuming dynamo has an output of 100 watts. 100 watts = 0.134 electrical horse-power (e.h.p.). At an efficiency of 60% dynamo would require at coupling 0.223 h.p. Turbine, therefore, has to develop 0.223 brake-horse-power (b.h.p.). Assuming efficiency of turbine to be 50%, then h.p. applied to turbine impeller has to be 0.446 = 14,718 ft.-lb. Quantity of water required to develop 14,718 ft.-lb. at a head of, say, 100 feet = 147 lb. per minute = say fifteen gallons per minute. If a battery were arranged to "float" across dynamo, governing mechanism could be dispensed with on the turbine, as the battery would keep the load on dynamo approximately constant.

CANDLE-POWER AVAILABLE.—Using "gas-filled" lamps, the dynamo (if 100 watt) would be good for approximately 140 c.p. By, however, suitably grading the capacity of battery, the lighting capacity of plant could be considerably increased by taking energy from dynamo and battery simultaneously, and running generating set "overtime" to recharge battery. HYDRO-ELECTRIC.

Garnant.



Are English riders becoming "soft" through the easy road conditions in this country? The English correspondent to an American journal says they are, forgetting the hundreds who compete in such events as the annual "London-Exeter." The above illustration depicts how the enthusiasts start off in rain, gale, and darkness on the 320 miles run of 24 hours duration.

### PRONUNCIATION OF "MAGNETO."

Sir,—With reference to the above in *The Motor Cycle* of December 15th, the following extracts may be of interest to "Puzzled," although I am afraid he will still be puzzled:

*Nuttall's Standard Dictionary*

Magnetize—Mag'-ne-tize.
Magneto-electric—Mag-ne'-to-e-lek-trik.
Magnetograph—Mag-net'-o-graf.

*Murray's Oxford New English Dictionary.*

Magnetize—Mæ-gnêt-eiz.
Magneto—Mæ-gni-to.
Magne-to-electric.

*Webster's Dictionary*

Magnetize—Măg'-nĕt-īz.
Magneto—Măg'-nĕt-ō.
Magnetograph—Măg'-nĕt-ō-grăf

Southfields, London, S.W 1 E.J.B.

[The lesser known accents used are illustrated in the various dictionaries mentioned as follows

"ė" as in "added"
"i̇" as in "thief."
"a̓" as in "am"
"e̓" as in "end." "recent."
"o̓" as in "obey" —ED.]

### SIDECAR FUEL CONSUMPTION RECORDS.

Sir,—During the Christmas holidays I made the following experiment. I put *one* gallon of petrol in the tank, and set off on a jaunt over give and take roads.

My average speed worked out to just under 45 m.p.h., and after running 190 miles I ascertained the amount of petrol left in the tank. Much to my astonishment, there was *one gallon and a half* of the precious juice!

My mount is a 1918 3½ h.p. Conkout, fitted with a Spitfire carburetter with six jets. Sidecar, home-made, consisting of a Ford body mounted on ordinary chassis. I travelled with five up. MUTT.
New Malden.

Sir,—Recent correspondence has called forth some remarkable statements from Triumph riders. There were two which particularly interested me. The first was that of "Top-hole." One hundred and forty miles per gallon is indeed good, and so is 64 m.p.h any time (with a sidecar!). Generally, when speeds such as these are indicated, I take it to be time for a speedometer overhaul. On one occasion my own speedometer registered 72 m.p.h. as I was wheeling the machine from a garage. NON SEMPER MENDAX.
St. Ives.

Sir,—The touring of a loaded pantechnicon across a couple of thousand miles of level going, using only Woodbine smoke as fuel, would no doubt be quite a simple matter to "Top-hole." SCOTT.
Leicester.

Sir,—With a machine in good condition, coupled with good driving, one ought to obtain at least 80 m.p.g. on a 4 h.p. outfit. May I give a few reasons for high consumption, *i.e.*, under-oiling, carburetter float badly functioning, spark too advanced or *vice-versa*, too high gear, insufficient attention to the air lever, improperly overlapped valves, and, the most common of all, a large jet. An engine must be oiled in proportion to its work, and not a pumpful of oil every so many miles, which is usually the idea of a learner.
JAS. REECE.

Sir,—The appreciative letters of Triumph machine riders who do umpteen miles per gallon have set me wondering again what is the matter with mine. As regards power and reliability I have nothing but praise, and have done tours of weeks' duration with sidecar passenger and luggage and nothing happen to the engine. I have never got more than 50 m.p.g. running with empty sidecar. A.C.M.
London, N.16.

Sir,—Dozens of riders of my acquaintance would never claim more than 65 m.p.g. with the old 3½ h.p. Triumph and coach sidecar. I cannot understand how it is possible to get more than twice that figure with a 4 h.p. outfit, as "Top-hole" states.

Can a meet be arranged for Triumph sidecar outfits some Saturday afternoon so that a test may be made? Each competitor to have a measured pint of petrol, and see how far he can go on the allowance. I would be pleased to organise the meet. Will correspondents please send particulars as follows: (1.) Year of machine. (2.) Type and make of sidecar. (3.) Type of screen. (4.) Weight of outfit. (5.) Carburetter and jet number. (6.) Gear ratios. (7.) Oil used and mileage per pumpful. (8.) Other particulars of interest.
Esher (on the Portsmouth Road) may be a convenient meeting place. H. B. BOOTH.

Sir,—If it were possible to complain of the Triumph sidecar owners' admirably furnished m.p.g. statistics, it would be on the score of modesty. "Top-hole" made a more skilful stab at Truth than his different *confrères;* but even he lamentably falls into modest ways during the course of his peroration by claiming a trifling speed of 64 m.p.h. with his trusty outfit *and* spares. ONION.
Shortlands.

Sir,—A correspondent signing himself "Top-hole" claims 120 to 140 m.p.g. and 64 m.p.h. with a 1917 Triumph *and sidecar* (with passengers).

I fail to see what good the making of such ridiculous statements does to the motor cycle movement. What chance would a professional stand against a machine of this type, either in a petrol consumption test or a speed trial, if the claims made were true? Give some people a lowish gear, a noisy exhaust, and a flying helmet, and Brooklands looks small.

Another correspondent, signing himself "Old 'Un," claims to have covered the mile (on the road) in 50s. (equal to 72 m.p.h.) on a pre-war single-gear Triumph. "Old 'Un" made a mistake in the timing: he should have said 1m. 50s. I am thinking of the fact that Dan Bradbury was the first man to exceed 70 m.p.h. on a 500 c.c., and that on a Norton in 1911. L. W. E. HARTLEY.

Sir,—I purchased a 1921 Triumph machine and light sidecar last May, and my average is only fifty-eight miles per gallon according to a Stewart trip speedometer, this district (near March) being quite flat.

Up to the present I have only done 1,724 miles, and have had the machine decarbonised once.

I note the secret mentioned by "Entirely Satisfied"; my gear is 5 to 1 top, every attention is given to valves and oiling engine, but I cannot obtain this big mileage, and there are several more in this district. A. E. FISHER.

[From the mass of letters we have received on this subject, of which the above is a representative selection, it is evident that many readers did not take "Top-hole's" claim of 140 m.p.g. and 64 m.p.h. in the spirit it was written. Mr. A. E. Fisher, whose letter appears above, also forwards us a reply which he received from the Triumph Cycle Co. on the question of fuel consumption. According to the makers, approximately 70 m.p.g. should be obtained with a 4 h.p. Triumph fitted with a light sidecar.—ED.]

### ELIMINATING MECHANICAL NOISE.

Sir,—I wish to thank all those readers who have so kindly replied to my query regarding the silencing of the Rudge valve gear. I am rather at a loss to know which gadget to try first!

While my query was meant to apply to the inlet valve gear, I would like to point out that the majority of the noise comes from the *inside* of the timing case, not from the mechanism outside it. The noise from the overhead rocker is merely a slight but annoying clatter, while the timing wheel noise is a decided "clank." It appears to me that this is unavoidable, due to the long train of wheels employed, thus exaggerating the backlash. One of your correspondents suggests filling the timing case with vaseline after closing up all holes from the crank case. I would like to ask him two questions. What happened when the engine was hot? I should be inclined to think that as soon as the grease melted the noise would be in evidence again. Secondly, how many "horse-power" did it take to turn the engine over to start on a really cold morning? Even as it is, my engine requires priming to free the piston and gears when the weather is at all on the cold side. But the timing case full of solid vaseline—ugh! MULTI-GEAR.
South Norwood.

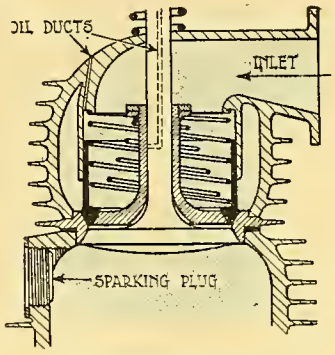
### REVIVING THE AUTOMATIC INLET VALVE.

Sir,—Is "H. Le Fe" seriously suggesting that an engine of the size which he suggests fitted with an a.i.v. would have the same or better power curve than with m.o.i.v.? Does he suggest that a 2½ h.p. (250 c.c.) J.A.P. engine, if it were converted to a.i.v., would rev. at 10,000 per minute, or would have a peak at about 7,000? Let us have suggestions, but let them have a basis on reason. After all, with present fuel, the only way to get more power from an engine is to raise the peak of the power by increased r.p.m. This considered, a.i.v. is a retrograde step.

L. W. E. HARTLEY.

Sir,—I enclose a sketch (not strictly to scale) of a valve gear idea which has occurred to me, and which might prove of interest to you or your readers, especially at present, when there seems to be a revival of interest in automatic inlet valves.

Its action will, I think, be fairly obvious, and is similar, I imagine, to that of the G.R.I. engine. It would appear to have the advantage over the latter of entraining a very small percentage of exhaust gases with the mixture and of expelling very little mixture with the exhaust—only the volume V between valves.



Concentric automatic inlet and exhaust valves suggested by "W.K."

The advantage of the very large central valve, open over two strokes and cooled by the incoming mixture, is obvious. The concentric automatic inlet and exhaust valves, working under comparatively cool conditions, could be made of duralumin, ensuring greater rapidity of action. The main valve seating would be renewable, and could be made of stainless steel, or something equally suitable. A detachable cylinder head would hardly seem necessary. The valve chamber could be held down and secured by long (external) vertical bolts and cross pieces.

If the automatic valves are still objected to, it might be worth while to secure the other advantages of the valve gear. In this case the concentric inlet and exhaust valves could be mechanically operated. For instance, the tubular stem of the inlet valve could be carried up through the top wall, like the main valve stem, and operated by a rocking lever from a groove cam on a vertical half-time shaft. This would cause the inlet valve to be alternately pushed down and raised up from its closed position, carrying the exhaust valve with it on the lift movement.

The main valve would in this case, of course, be also operated directly from the half-time shaft, like the Reyre Newson and some other make whose name I have forgotten.

Stafford. W.K.

[It is hardly correct to liken this design to the G.R.I., which has a single poppet valve and a rotary distributing valve. —ED.]

Sir,—Without wishing to raise a heated controversy in relation to a.i.v. *v.* m.o.i.v., I should like to point out to "H. Le Fe" that he would not get the same results from a 2 h.p. M.A.G. twin by replacing m.o.i.v. with a.i.v.'s.

I have been experimenting with a 2 h.p. four-stroke Moto-Rêve twin (which is out of the same stable), 1912 model, a.i.v. over exhausts. I purchased another Moto-Rêve (1911) for the sake of a new magneto and for spare parts; in fact, the exhaust valves of this latter engine are now the m.o.i.v. of the former. Both these machines ran well, but after full throttle for three or four miles would dry up. I drilled holes in the crank case tops, which improved them, and made them go farther before this happened. However, I made one decent machine out of two; I dropped the straight top tube considerably, lowered the engine in the frame, and also the saddle position. I fitted a spring frame, T.T. bars, a 2¾ h.p. Douglas two-speed gear box, and a new magneto and carburetter. I rode this machine for several months, and by going steadily and using bottom gear for hills could travel long distances; but to take a hill on top or all out on level would soon pull it up and stop. I fitted the machine with m.o.i.v. Without altering anything else except inlets and operating mechanism, I find that the result is quite a revelation in the starting and running. I have quite one-third more power, take all decent hills on top, and reel off mile after mile with no attempt at drying up, and the engine does not require priming and the carburetter flooding. I have a slightly higher petrol consumption. In reference to "H. Le Fe's" last remark that the M.A.G.'s power is derived from "large inlet valves" and modern construction, all V twins and horizontal twins, even the very old type, could rev. owing to an impulse every revolution, and the modern twin more so from overlap given to the valves. Therefore by reintroducing a.i.v. to this engine he would lose the advantage of overlap and a full cooling charge, the old fault of heating up and falling off of power resulting.

Hampton-in-Arden. L'ABEILLE.

### NO ENGINE AND FRAME NUMBERS—NO LICENCE!

Sir,—I wonder if many of your readers have had as much trouble as I have to renew my licence for 1922! According to my registration book, the renewal form R.F.1a is obtainable from a money order post office, but I tried five on Saturday, December 31st, without success, amongst them the General Post Office in this city. Of course, the local registration office was closed for the half-day. Eventually in disgust I left it until January 2nd, though I must confess I derived some amusement from the various excuses offered for having no forms.

The most amusing part, however, occurred when I visited the local registration office. Here I was refused a renewal of my licence because I did not know the engine number and frame number of my machine. In vain I offered to let the clerk come outside and find the vanished numbers, and I explained that two motor engineers in the city had already made a fruitless search for them. The clerk was adamant—"no numbers, no licence." I was told and I was even threatened with a fine for not having supplied earlier numbers which apparently do not exist!

I was thereupon ordered to have numbers put on if I wanted a licence—"any number would do." Now I know the law is supposed to be "an ass," but surely it is not such an ass as to insist on entirely fictitious numbers being placed on one's machine. Perhaps one of your readers can enlighten me on this point. It seems to me if I do as I am ordered (and I can see no alternative if what I am told is true), and I subsequently sell my machine as a "1917" model, a purchaser might later return and accuse me of fraud, as the engine number of the 'bus showed that it left the works in 1910!

Perhaps any other readers who have experienced the same difficulties and wasted the same time will voice a complaint, with a view to ending these continual and annoying "pin-pricks" by the authorities.

# DIRT TRACK RACING in the U.S.A.

## The Risk of Riding Big Capacity High Speed Machines on Half-mile to the Lap Dust Tracks.

By E. B. HOLTON.

MOST of the popularity motor cycle racing has gained in the United States is due to competition on half-mile dirt-surfaced tracks. Originally constructed for trotting and pacing races for horses, these ovals dot the map from Maine to California. For a time during the ascendency of the automobile the tracks lay idle, the stands and fences decayed, while the tracks themselves were grass-grown and neglected. Then the motor cycle was rolled out upon the neglected surfaces, and like a prairie fire the idea of competition between machines swept through the country.

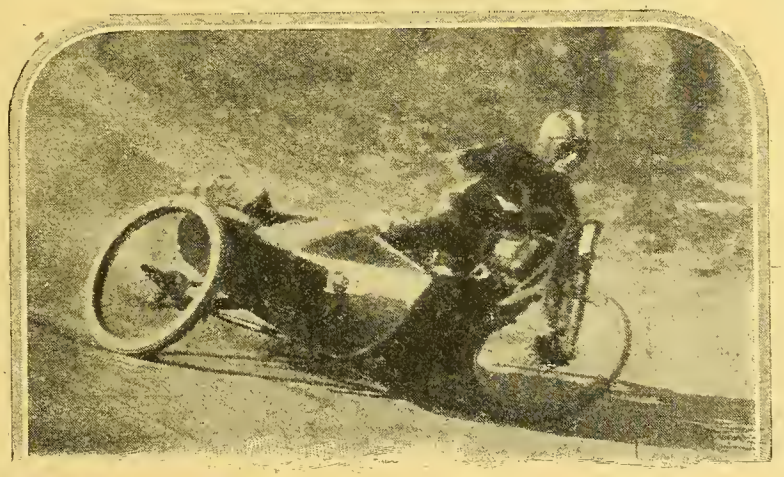
While many of the tracks are one mile to the lap, the majority are of the shorter distance. Through Ohio and Indiana, especially, the races are the real sport of motor cyclists. As many as three meets within a radius of eighty miles have been held in the State of Ohio on the same day, and all drew paying crowds.

### Fences, Poles and Dust.

Wise rules restricting the size of engines permitted upon half-mile tracks have tended to cut down the accidents that go with speed competitions, but there are two evils over which the M. and A.T.A. (the governing body) has no control, and they serve to cause a fatality now and then. These are dusty tracks and fences that surround the oval, either on the pole or the outer edge.

With three men fighting for the lead, a heavy plume of dust hangs over the track, and in spite of precautions such as calcium chloride or light oil spread on the surface, a haze is raised that is difficult to penetrate with the eye. Fences should be torn down. They claimed as a victim one of the best competition men in the United States, when Albert Burns crashed into a pole on the Toledo track in August last. Because the track owners do not wish to have their fences removed, motor cycle promoters and riders are willing to "take a chance" that no one will be hurt during the meet.

For a time during the past racing reason it looked as though sentiment favoured barring sixty-one cubic inch engines (1,000 c.c.) from competition, except on speedways of more than one mile to the lap. Something should be done regarding the restriction of sizes in competition, but so long as the trade dominates the M. and A.T.A. Competition Committee, nothing will happen.



Rounding a corner at 60 m.p.h. on a dirt track in America. Note the sidecar wheel leaning over at the same angle as the bicycle wheels.

### Big Capacities Favoured.

At Chicago an attempt was made to put on a 37in. (600 c.c.) class, which would develop racing between the various sport models. The factories put "thumbs down" on the proposals, however, asserting that they did not care to develop another size of racing eigine. With the rank and file of the M. and A.T.A. supine, the trade will "get away" with their dictatorial methods.

That 61in. motors have developed beyond the bounds of safety is proved by a glance at the M. and A.T.A. records made last season in competition and against time.

Fred Ludlow (Harley-Davidson), on the one mile dirt track at Syracuse, N.Y., won six short distance M. and A.T.A. championships, averaging over 80 m.p.h. in the races under ten miles and crowding 78 m.p.h. in the twenty-five and fifty miles'

**Dirt Track Racing in the U.S.A.—**

events. That was in competition with seven others. Gene Walker (Indian), on a one-mile track at Maxwellton, St. Louis, Mo., on November 8th, created a new set of "against time" marks from one to ten miles. The mile was ridden in 42.3s., approximately 85 m.p.h. The five miles now stands at 3m. 38s., averaging 43.6s., or 83 m.p.h., while the ten miles mark is 7m. 23.6s., or about 80 m.p.h. In the sidecar races, too, high speeds for one mile tracks are again apparent. Floyd Dreyer, with an Indian-Flexi outfit, set up a row of new figures at Toledo, Ohio, the day Burns was killed. Dreyer's time of 51⅖s. for one mile hovers around 70 m.p.h., and from that distance on up to twenty-five miles he circled the track averaging 65 m.p.h. for the ride.

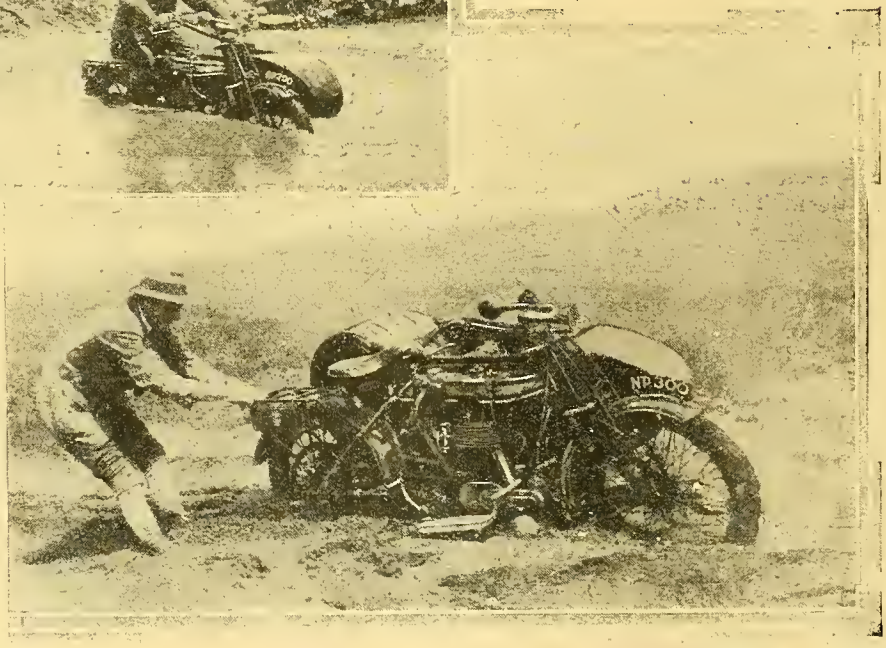
# OVERSEAS CONDITIONS: Gaining First-hand Information.

FROM time to time we have been able to give a few notes with regard to Mr. J. L. Norton's overseas tour. It will be remembered that the trip was undertaken partly with the idea of obtaining first-hand information of the conditions under which British motor cycles have to operate in other lands.

The illustrations which we are now able to publish by the courtesy of Norton Motors, Ltd., show Mr. Norton's Big Four sidecar outfit under various "road" conditions in South Africa. The photographs were taken by Mr. Norton and his companion on a trip between Durban and Johannesburg, and show the state of the "main road."

FROM DURBAN TO JO-BURG

(Top) This picture provides a good example of the conditions encountered on the best road between Ladysmith and Newcastle.



(Centre) "One of seven fords and by no means the deepest." Mr. Norton, who is seen in the saddle, states that he crossed more than thirty-five spruits on this trip. (Bottom) The outfit sunk in mud and sand almost to the axles; good clearance between tyre and guard is obviously a necessity.

### Lessons Learned.

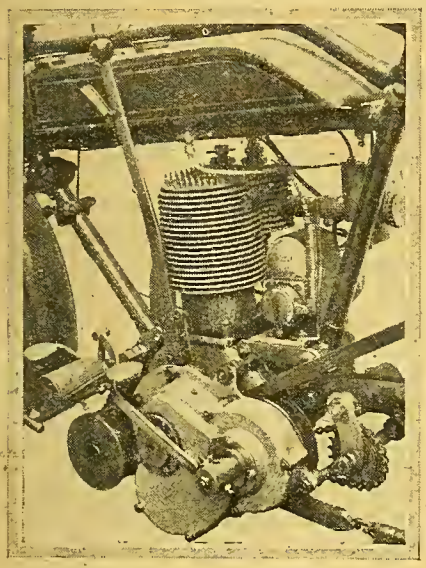
Two of the photographs emphasise the need of good ground clearance, stout wheels and spokes, and wide mudguard clearance, while another shows the necessity for waterproof ignition appliances. Conditions such as this would delight the hearts of the organisers of the Scott trial, but would daunt some of the fair weather riders in this country.

Odd photographs of bad roads often reach us, but it is seldom that they convey such a clear impression of the actual conditions encountered in a long-distance trip over main roads.

# AN ENGINE SHAFT THREE-SPEED.

## "Machine Tool" Type of Rocking Pinion Gear for Motor Cycles.

THOUGH there are a number of new countershaft gear boxes on the market, there are but few engine-shaft gears of modern design. This is rather curious, since a smaller and lighter box might be employed if run at engine speed. Such engine-shaft gears as are marketed are of the epicyclic type, and consequently the three-speed gear which has been evolved by W. Doleman, of 44, King Edward Road, Coventry, is of considerable interest.



Doleman's engine shaft three-speed gear. All ratios are indirect, and engagement is effected by a rocking motion of the intermediate gear shaft.

In this gear a single pinion is mounted on the engine-shaft, and three pinions are keyed to the pulley, in which is placed the clutch. The connection between these shafts is by means of three gears mounted intermediately and rocked into engagement as required. There is no sliding motion. The gear which we inspected was attached to a 6 h.p. single-cylinder Condor engine, and has, we are told, been in use for seven years, so that it may fairly be claimed to have been tested out.

### Not Unduly Clumsy.

Even in its rough state, the experimental box is not unduly clumsy, though it will be considerably neater and lighter in its marketable form. One of the attractions claimed by the inventor is that almost any existing single-geared or hub-geared machine can be converted without any structural alterations. The gears are shifted by a lever extending upwards from the box to the side of the tank; and, though the clutch in its present form is pedal-operated, it would be easy to provide a handle-bar control. Experimentally, a kick starter is connected to the pulley shaft through a short chain.

# FOOT GEAR CONTROL.

## Suggested Single Pedal Operation for Three-speed Gear Boxes.

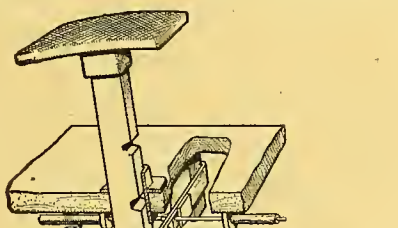
THAT a great many riders prefer foot gear control is very evident by the way in which D.R.'s and others almost invariably adapted the earlier Sturmey levers to a "pedal change," but a simple and sure foot-operated system for a three-speed gear box has yet to appear on the market. Many difficulties confront the would-be designer. Considerable interest, therefore, attaches to this suggestion of a reader (Mr. G. F. Godfrey, 45, Charles Street, Great Berkhamsted, Herts.).

Briefly, a vertical pedal works in guides in the footboard, and is linked at its lower extremity to a long pivoted lever (one end only shown), which in turn is linked to the gear actuating arm on the gear box. Pressure on the pedal, of course, extends the tension spring. When only one horizontal pivoted lever is used, the design is only applicable to gear boxes in which the gear actuating arm *moves upward to change up;* it should not be difficult, however, to arrange it for use with the more common type of box, where the arm is down in top gear.

### Semi-automatic Operation.

In action, the pedal is pressed down to change up, the action of the spring being sufficient to change down. Now comes the ingenious point of the idea. A spring catch engaging in slots in the pedal is released by a wedge soldered on to a bared portion of the clutch wire. As soon as the clutch is sufficiently released, the wedge clears the projection on the catch, which then flies back, thus engaging the next slot and locating the next gear position. Gear changing, therefore, amounts to lifting the clutch lever and pressing the pedal to change up, and simply lifting the clutch lever to change down.

Although there is a considerable amount of "timed mechanism" in this design that would have to be kept in constantly correct adjustment, there appears to be no inherent objection to the general principle. And it would be very convenient!



How Mr. G. F. Godfrey's scheme for foot-gear change might be adapted is illustrated by this drawing. The inset shows the action of the clutch-wire-operated spring catch.

# SIMPLIFYING FORK SPRINGING.

## Workmanlike Simplicity a Feature of the Flexifork.

ALTHOUGH spring fork designs are almost too numerous to mention, the latest example of a design which was first exhibited at the 1920 Olympia Show contains several details worthy of comment and praise.

Known as the Flexifork, and manufactured by the Flexifork Manufacturing Co., Ltd., of Tyseley, Birmingham, the springing device under review combines both vertical and horizontal motions with the simplest possible construction. Only one rocking link is employed, and the only exposed springs are of the leaf type.

A spring fork of simple design employing leaf and coil springs—the Flexifork.

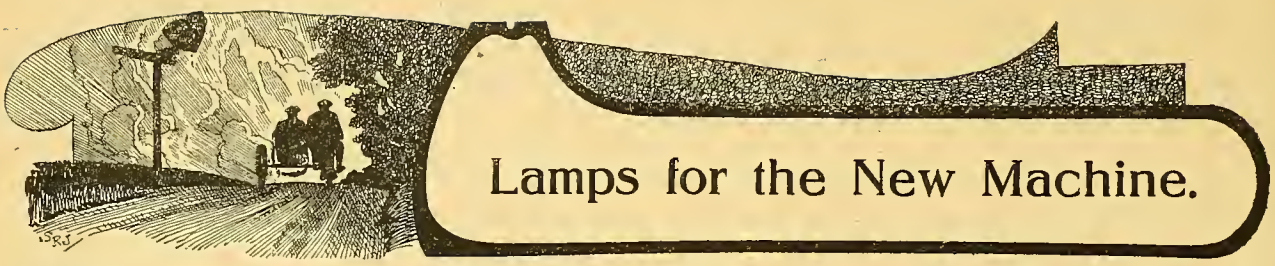
Briefly, the fork consists of two trussed vertical tubes swinging from the steering column crown on a one-piece stamped shackle. Inside the tubes are compression springs, which support plungers connected together by a bridge piece, and the crown is connected to the bridge by an upright laminated spring. The distance between bridge and crown being inextensible in a vertical direction, an upward displacement of the wheel results in the internal coil springs being compressed against the plungers as the shackle swings upwards. In addition to vertical motion, the force of the front wheel striking obstacles is converted to a horizontal swinging of the fork about its front shackle spindle, and this movement is checked by the leaf-spring, which is curved forward slightly. Altogether, the fork is a most workmanlike design, and the simplicity of its construction, allied with the range of its movement, should ensure its acceptance in the front rank of proprietary components.

---

# EXHIBITORS AT THE BELGIAN MOTOR CYCLE SHOW.

ALTHOUGH motor cycles were shown at the last Belgian Automobile Show, there is to be a second motor cycle show in Brussels. It will be held from February 25th to March 5th in the Palais Degmont, and the following machines will be represented: James, Norton, Henderson, Rudge, P. and M., Triumph, A.J.S., Sunbeam, Dunelt, Radco, B.S.A., Harley-Davidson, A.B.C., Gnôme-Rhône, Janoir Rally, Ace, Evans, Indian, Gillet, Blériot, Saroléa, Arco (sidecars), American X, Griffon, Rush, Hinstin, Peugeot, and Salmson cycle cars.

A large number of tyres and accessory firms will also have stands at the Palais.



# Lamps for the New Machine.

## Wise Hints on the Selection of Lighting Equipment. Some Particular Instances Discussed.

AT this time of the year a great many riders are anxiously considering what lighting installation they shall adopt on the machines on which they will take the air of 1922.

The points which concern us are weight, cost, convenience, reliability, light, and—in a few cases—horse-power. The following principles may be laid down quite dogmatically, as governing all selection:

(1.) An acetylene generator set is still the cheapest system available, and must be adopted where economy really matters. A small set of the "bobby-dodger" variety can be obtained as low as 30s. complete.

(2.) Tail lamps are no longer legally compulsory on solo machines. The wise rider will still use one, as they make for safety in heavy traffic, and whenever the machine is stationary on the road after dark. Dry battery tail lamps are very cheap to maintain.

(3.) Electric installations which utilise the surplus current generated by the magneto to charge an accumulator give just enough light for a medium-powered machine, and no more.

(4.) Dry battery head lamps are quite as expensive as outfits which give a really long ray, and cannot afford sufficient light for a fast machine. They are to be recommended for intermittent pottering after dark, when convenience is of more account than light or speed or economy.

(5.) Most powerful sidecars demand the equivalent of two good head lamps; the toy side lamps often fitted are no real use to hard riders.

(6.) Electric head lamps, fed from accumulators of which the discharge rate is not artificially limited, give a far better light than any rival system; and should certainly be used by riders whose vision is below par.

(7.) Dissolved acetylene is heavy; not too cheap; handicapped by the awkward size of the gas cylinder. Its ray is steady, and its reliability absolute. As an illuminant, it is quite the most efficient for the hard rider who cannot afford a dynamo, and who possesses good facilities for charging accumulators.

(8.) Fast machines should not have heavy outfits permanently fixed to their handle-bars; a big 20 a.h. accumulator is quite out of place on a T.T. bar. A light gas lamp, removable by unscrewing two nuts, is the only fitting equipment for a sports 'bus.

(9.) Dynamo outfits absorb at least $\frac{1}{20}$ h.p., and are therefore out of place on a machine which is expensive because it is designed to furnish the maximum b.h.p. with a minimum weight.

(10.) The dynamo outfit is without a rival on the *de luxe* heavy touring machine.

These principles may now be applied to a few individual cases, by way of illustration.

Miss Ruth Jones is district commissioner for the Girl Guides, and papa is buying her a baby two-stroke. Papa supplied the Allies with gas masks during the war, and need not look twice at a Fisher.

RECOMMENDED.—Such a set as the B.T.H. Sparklight, supposing the lady's choice does not possess a flywheel magneto.

Major Vere de Clare (retired); lives in four country cottages, which he has converted into a bijou residence. 2½ miles from the club and golf links. Pension—not too extensive. His transport is a rather aged 2¾ h.p. Douglas. He is elderly, and never rides fast; doesn't keep a man; hates messing round with the machine.

RECOMMENDED.—Dry battery head and tail lamp, such as Hunt, Ward and Goldstone, Siemens, etc. Fair light, no trouble, not expensive, quite reliable.

Doctor John Brown (late R.A.M.C.) has bought a small rural practice with his gratuity. Has also recently married. Funds not too ample. Rides an ex-W.D. Triumph, and has to look at every shilling. Goes out every night, and several times a night.

RECOMMENDED.—Should touch his favourite aunt for a Maglita or Magdyno. Otherwise, dissolved acetylene or a first-class generator set, with dry battery tail lamp in each case.

Eric Smithers; jeweller in a small town; courting a damsel five miles away. Rides a 5-6 h.p. sidecar. Saving up to buy furniture. Wears pince-nez, and frequents twisty lanes, when he is rather exalted after a long evening with his fiancée.

RECOMMENDED.—See advice offered to Dr. J. Brown, above; but should fit *two* head lamps.

George Sparks; one of the boys. Rides a Brooklands Special Norton rather well. Races on it in the season. Money no object.

RECOMMENDED.—Dry battery tail lamp (easily unstrapped). Lamp-cum-generator set on double handle-bar bracket, of the type secured by two nuts, and unscrewed in a moment.

Abraham Steadyman; draper in urban district. Just moderately prosperous. Eschews night driving when possible. Aged 32. Has a brother-in-law who runs a garage. Rides a B.S.A. solo.

RECOMMENDED.—Handle-bar set with accumulator, minus dynamo; £5-£8 being quite enough to pay for occasional use, and recharging (in the family) being a simple matter.

Percy Fitzcash; age 19. Has an honorary post in papa's business, pending a directorship on his 21st birthday. Rides a new machine every six months. Seldom to bed the same day on which he got up.

RECOMMENDED.—Full dynamo equipment, and hang the expense.

ROAD RIDER.

## Special Features.

TO THE RIVIERA BY MOTOR CYCLE
DIRT TRACK RACING.
LAMPS FOR THE NEW MACHINE.

### Times to Light Lamps.

| | | | |
|---|---|---|---|
| Jan. | 12th | ... ... | 5.13 p.m. |
| ,, | 14th | ... ... | 5.16 ,, |
| ,, | 16th | ... ... | 5.19 ,, |
| ,, | 18th | ... ... | 5.22 ,, |

Number plates to be illuminated thirty minutes earlier, *vide* Road Vehicles Registration and Licensing Order (1921).

### The Scottish Motor Show.

230 firms will exhibit at the Scottish Show, which opens on the 27th inst. at Kelvin Hall, Glasgow.

### Popular Trial in Early Spring.

Saturday, March 18th, has been fixed as the date of the Birmingham M.C.C. Victory Cup Trial, which, although not officially "open," generally attracts a big entry from all over the country.

### An R.A.F. Reunion.

Under the chairmanship of Brig.-Gen. Bagnall-Wild, C.M.G., C.B.E., the second annual reunion dinner for officers attached to Martlesham Heath Experimental Station will be held at the Café Royal, Regent Street, London, W. The date fixed is Friday, January 20th, at 7 p.m. Old members should communicate with Capt. P. G. Robinson, Room A 139, Air Ministry, Kingsway, W.C.2.

### The T.T. Dates.

In addition to the many opinions concerning the unsuitability of the pre-Whitsun week for the T.T. races, we have received a cablegram from Mr. W. H. Wells, of the Indian firm, reading as follows: "Consider holding Tourist Trophy races just preceding Whitsun holidays detrimental to traders and manufacturers' interests. Suggest September most suitable."

In testing the opinion of those who entered last year, we did not receive any which did not support our view, and action is now being taken to consider an amendment of the suggested dates. We deal with this subject in the leading article of this issue.

### Information Wanted Regarding Trials Accident.

We regret to have to announce that C. Chawner (a Coulson rider) was rather seriously injured in the recent London-Gloucester trial. While near Wheatley he was dazzled by the head lights of an approaching car, which suddenly turned down a side turning without warning, with the result that he collided with it. Mr. C. H. Alcock, London Motors, Ltd., 61, Holborn Viaduct, London, E.C.1, will be very grateful if anyone who witnessed the accident will communicate with him.

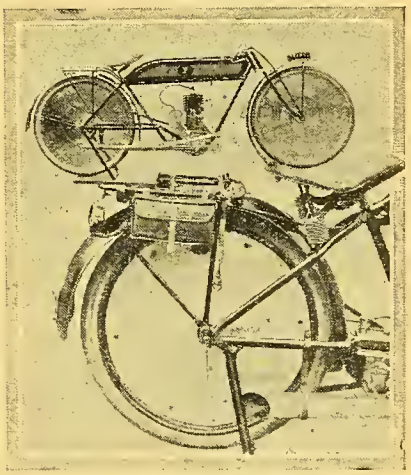
### The Car T.T.

Three each—Sunbeams, Vauxhalls, and Bentleys—have been entered for the big car race in June next. For the 1,500 c.c. class three Sunbeams, one A.C., three Aston-Martins, three Crossley-Bugattis, one Hillman, three Talbot-Darracqs, and one Alvis are entered.

### "The Motor Cycle" Film in the North.

To-day the Colne and District M.C.C. is showing *The Motor Cycle* film, and on Saturday the Leeds and District M.C. is arranging an exhibition. On Monday it goes to Widnes, where it will be shown at the Co-operative Hall by the local Motor Cycle Club; on Tuesday at the Engineering Lecture Theatre of the Liverpool University; and on the following day at the Kinema Exchange, Bold Street, Liverpool, on behalf of the Liverpool Motor Club. Appreciations of the film continue to reach us from wherever it is exhibited.

THE FIRST MOTOR RACE ON ICE. On Thursday of last week, two Harper runabouts, driven by Mr. R. O. Harper, the designer, and Capt. Armstrong Graham respectively, competed in a race at the Manchester Ice Palace. The rink measures 150 × 105ft., yet an average speed of 23 m.p.h. was attained by the first mentioned driver, who won this extremely novel and interesting event by fifty yards.



A MODEL MOTOR CYCLE.

This interesting model is being exhibited at the Model Engineers' Exhibition during the present week. It is fitted with a ¼ h.p. two-stroke petrol engine and carburetter, and is an actual working model. The engine works perfectly well with coil and accumulator ignition, no magneto being made sufficiently small for use with this "miniature."

### Reunion Dinner.

It is proposed to hold a reunion dinner of officers of the late No. 1 Aeroplane Supply Depot (St. Omer, Marquise, and Cologne), to take place at the Hotel Cecil on Saturday, the 28th inst., at 7 p.m. All those interested are asked to communicate with Capt. J. F. Bargman at Inglefield, Osborne Road, South Farnborough.

# PRICES OF SECOND-HAND MOTOR CYCLES.

## The Cost of Year-old Machines Compared To-day with a Year Ago.

IT cannot be considered surprising that second-hand machines may be bought much more cheaply to-day than was the case a year ago. Prices of new mounts have fallen greatly in the interval—a state of affairs that tends to cause chaos in the second-hand market. Now, however, things are calmer, for it is generally realised that 1922 prices have been stabilised for some time to come, and it is thus possible to form fair averages for the majority of the second-hand models being offered to the public.

### To-day and Twelve Months Ago.

Taking some typical prices of year-old machines this and last year, it will be found that the solo A.B.C. has dropped from £118 to £70, A.J.S. sidecar outfits from £202 to £180, the 2¾ h.p. Douglas from £89 to £62, 7-9 h.p. Harley-Davidson sidecars from £199 to £150, 8 h.p. Matchless sidecars from £191 to £140, 3½ h.p. Norton from £112 to £102, 3½ h.p. Rudge from £95 to £72, 3½ h.p. Sunbeam from £140 to £106, and 4 h p. Triumph sidecars from £148 to £107 10s.

It should be appreciated, however, that the present is usually the period when prices are at their lowest, and also that the above averages are governed by conditions external to what might be the actual state of affairs were there a larger number of machines offered on which to base average figures.

The table below gives the average prices, where possible, of the 1919, 1920, and 1921 models advertised in the classified miscellaneous advertisements in the current issues of *The Motor Cycle*.

| | 1919. | 1920. | 1921. |
|---|---|---|---|
| 3 h.p. A.B.C. | — | £60 | £70 |
| 10 h.p. Ace | — | — | £148 |

# CLUB NEWS.

### Coventry and Warwickshire M.C.

This well-known Midland club is holding a ball on the 20th inst. Mr. Eric Barnett, of Francis and Barnett, Lower Ford Street, is organising secretary.

### Sutton Coldfield and N. Birmingham A.C.

The ninth annual dinner and prize distribution of this club will be held at the Royal Hotel, Sutton Coldfield, on the 20th inst.

### Midland Cycling and Athletic Club.

The annual prize distribution of the club took place last Friday evening at the White Horse Hotel, Congreve Street, Birmingham, and was attended by many prominent members of the cycle and motor cycle world. The President, Mr. Chas. F. Dawes, took the chair, and made the presentations midway between a very enjoyable concert.

In addition to the trophies, there were thirty gold medals, seventeen gold-centre medals, and twenty-eight silver medals presented.

### Cumberland County M.C.C.

Mr. T. W. Loughborough, A.M.I.A.E., secretary of the Auto Cycle Union, will occupy the chair at a lecture to be given to the club by Mr. W. Theodore Carr, M.P., on Saturday, January 14th. The club will meet at the Crown and Mitre Hotel, Carlisle, at 8 p.m.; and Mr. Carr's lecture, which will be illuminated by some interesting lantern slides, will be entitled "Motoring: Ancient and Modern." All motor cyclists and motorists are cordially invited to attend.

cs

### Herts M.C. and L.C.C.

A most interesting paper-chase was held recently in the Puckeridge district, and some fifteen competitors ploughed their way over a fifty miles course, many false trails being laid. A silver medal was awarded to T. D. Chapman (8 Zenith sc.), and a bronze medal to G. Chaplin (3¾ Scott).

### Public Schools M.C.C.

Col. F. Lindsay Lloyd, C.M.G., occupied the chair at the annual dinner, which was held at the Public Schools Club, 61, Curzon Street, London, W.1, at 7.30 p.m. on Thursday last. Immediately after the dinner the prizes gained during the season were presented. The challenge cup for the highest aggregate of marks during the season was earned by the secretary, Mr. H. B. Browning, who resigned this in favour of Capt. R. C. Charlesworth. The prizes were unique, and consisted largely of neat, artistic miniature silver cups. L. Yeowell, who won the Brooklands race, was presented with a tobacco jar and a set of Dunhill pipes. No medals are presented by the Public Schools M.C.C.

After the prize-giving, the annual general meeting of the club took place. It was agreed that the subscription for the year 1922 should be one guinea, while a further sum of 10s. 6d. would cover the entry for all competitions. Col. Lloyd offered to present the club with a cup and also the use of Brooklands track on a Saturday afternoon (when not engaged) for an impromptu race meeting. The secretary's address is 14, Hogarth Road, London, S.W.5.

### Essex M.C.

One of the oldest clubs in the king dom, the Essex Motor Club, was favoured with the company of many distinguished pioneers of the sport on the occasion of its sixteenth annual banquet at the Holborn Restaurant, London, on Saturday last. Mr. Sidney G. Cummings was in the chair. An excellent dinner was pro vided, whilst the many musical items de manded no less appreciation. The pro ceedings were confined solely to speeches, since it had been decided to exclude the prize distribution—usually a somewhat laborious business. Following the Chairman's toast of "The King," Mr. Duncan Watson, proposing the toast of "The Club," paid a strong tribute to Mr. Geo. Reynolds, the founder, and to the untiring efforts of Mr. Ernest J. Bass, the hon. secretary. The club had achieved much in the past, and had acquired a high reputation, and as for the future there was little doubt that the Royal Brooklands meeting, fixed for May 20th, would attract a record number of competitors and spectators, and create for the club the popularity it deserved.

Mr. Geo. Reynolds, in reply, said that the past year had been an unusually successful one, in which no fewer than £400 had been expended on awards, and the annual turnover exceeded £3,000. The outing for crippled children had given much pleasure to many little ones, whose lot was a very hard one, and the support given by the members was most encouraging. It was hoped that the same support would be given to the Brooklands race meeting and carnival on May 20th, when

**Club News—**

H.R.H. the Duke of York had graciously promised to be present, and the proceeds, exclusive of expenses, would be given to charities nominated by His Royal Highness.

### Avon M.C.C. (Bristol).

A club has been formed as above with headquarters at the Bush Hotel, Totterdown. It will deal mostly for the touring motor cyclist with social runs and an occasional sporting event. The club flag is pennant shape, 9×5in., colours being dark blue and yellow (vertically), blue to flagstaff. The hon. secretary is Mr. Conrad Alien, to whom all communications should be addressed at headquarters.

### Birmingham M.C.C.

Only nine competitors qualified for gold medals in the very sporting Boxing Day trial described last week. Full results were :

SILVER CUP FOR BEST SOLO PERFORMANCE.—B. H. Riley (2¾ A.J.S.).
SILVER CUP FOR BEST SIDECAR PERFORMANCE.—H. S. Perry (6 B.S.A. sc.).
GOLD MEDALS.—G. J. Francis (2¾ Francis-Barnett), A. Thrush (3½ Sunbeam), D. Brandish (4 Triumph), G. Butcher (3½ Sunbeam), T. Watson (3½ Sunbeam sc.), T. H. Walker (6 B.S.A. sc.), and H. V. Collins (3½ Norton sc.).
SILVER MEDALS.—Bert Kershaw (2¾ New Imperial), T. Wooley (2½ Sun-Vitesse), G. C. Jenkins (4¼ B.S.A. sc.), and B. L. Bird (6 B.S.A. sc.).

### Cork and District M.C.C.

The results of the St. Stephen's Day trial are as follows :

SOLO CLASS.—1, C. W. Manley (3½ Triumph); 2, R. S. Russell (3½ Scott); 3, E. Manley (3½ Triumph). Novices' Prize: J. J. Ahearne.
SIDECAR CLASS.—1, E. B. Russell (5 Brough); 2, J. Gibbings (6 A.J.S.); 3, C. S. Harford (8 Blackburne).

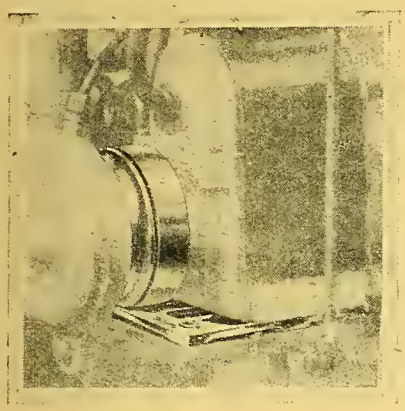
# A Magneto Attachment for Easy Starting.

## The S.A. Impulse Starter.

## A Device to Minimise the Physical Effort of Starting the Engine.

IN the car world the type of delay action magneto coupling known as an "impulse starter" has already achieved some popularity, but hitherto the use of these devices has not been largely applied to motor cycle engines.

The term "impulse starter" is a misnomer, as the apparatus is merely an aid to starting by the ordinary methods of rotating the engine. Briefly, all these fitments follow the same general plan, wherein the driving element of the magneto transmission is connected to the armature by a spring-loaded device



The complete assembly mounted on a Triumph machine by means of the special extension base plate.

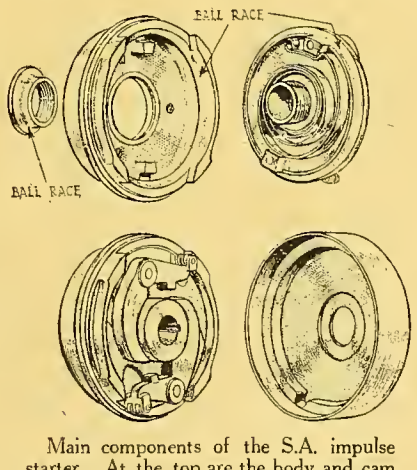
which operates at very low speeds only. The armature is not rotated at low speeds throughout a portion of the engine's cycle of rotation, the magneto drive meanwhile winding up a "clock" spring; when the engine has just passed its normal firing point, the wound-up spring is released by a cam action, and the magneto armature is flicked rapidly over its maximum position by the freed power stored in the coiled spring, and an intense spark is given by a magneto speed which bears no relation to the speed of the engine. As soon as the engine fires and runs at a reasonable speed, the impulse device is automatically cut out, and the magneto coupling runs solid, giving an ordinary drive.

### Construction Details.

Following the general lines above described, the S.A. impulse starter, made by S.A. Impulse Starter, Ltd., of 77, St. Mary Street, Cardiff, is a typical example of its kind, and appears to have been thought out with due regard to the mechanical conditions under which it must work.

In fitting the S.A. starter to a motor cycle magneto, there are two parts which must be permanently secured to the magneto. The first is an extension base plate, which places the magneto on its platform in correct relation to the driving sprocket, allowing for the width of the additional parts; and, secondly, the back plate of the starter itself, which is fitted to the end of the magneto, and through which the armature spindle projects. This back plate contains an annular ridge, which has a small depression at one point.

Mounted on the spindle is the body of the starter, which carries on its back a rocking lever—two for a twin-cylinder machine—carrying two rollers at one end and a heavy mass of metal at the other. On the front of the body are cast two blocks, diametrically opposed, and the centre provides an anchorage for the "clock" spring. Running on this portion on ball bearings is the driving element on which the sprocket is mounted. This piece has also two blocks corresponding to those on the main body, and also has a cam (or cams) which projects as far as, and runs beside, the annular ridge in the back plate. The free end

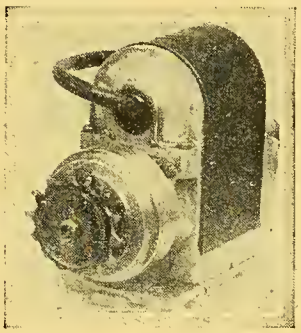


Main components of the S.A. impulse starter. At the top are the body and cam plate; below, the two are assembled ready for insertion within the stationary back plate.

of the coiled spring is formed with a loop, and engages one of the blocks on the cam plate.

### The Device in Action.

In operation the engine is slowly rotated, the two blocks on the cam plate and body of the starter respectively being held together by the peculiarly shaped depression in the coiled spring. The magneto armature is rotated until the piston approaches the top of the compression stroke. At this moment the roller



S.A. impulse-starter fitted to an M-L magneto.

end of the lever on the body drops into the recess of the annular ring on the fixed back plate, so locking the body and with it the armature. The sprocket and cam ring travel on (with the rotation of the engine), the block on the latter pulling on the spring, which is thus wound up until the piston has just passed top dead centre. At this moment the cam comes into engagement with one of the rollers on the rocking lever, releases it from its engagement with the back plate recess, and allows the spring to flick over the armature, so that it catches up the sprocket, at the same time producing a spark of good intensity, for, obviously, the ignition control is not retarded, although the spark occurs after top dead centre.

As soon as the engine speed exceeds about 80 r.p.m., the heavy mass at the end of the rocking lever throws out by centrifugal force, and the device then runs as a solid coupling by virtue of the fact that two blocks—one on the cam ring and one on the body—are locked together by the previously mentioned depression in the end of the spring.

# NEW YEAR TRIAL IN SCOTLAND.

## Point to Point Run to Perth of the Western M.C.C. (Glasgow).

BRIGHT weather and good roads made the Glasgow Western M.C.C. New Year "point to point" run to Perth a most enjoyable outing.

The run was the same as previous years—to Perth and back, with checks at Stirling both ways.

Amongst the competing machines there were several new models, some of which had not been seen in competition on the northern side of the Border before.

R. Watson was riding a 1922 Martinsyde sidecar outfit, and G. Templeton was riding a 3½ h.p. of the same make. The Royal Scot, ridden by J. Donaldson, did credit to itself on this its first appearance in competition work.

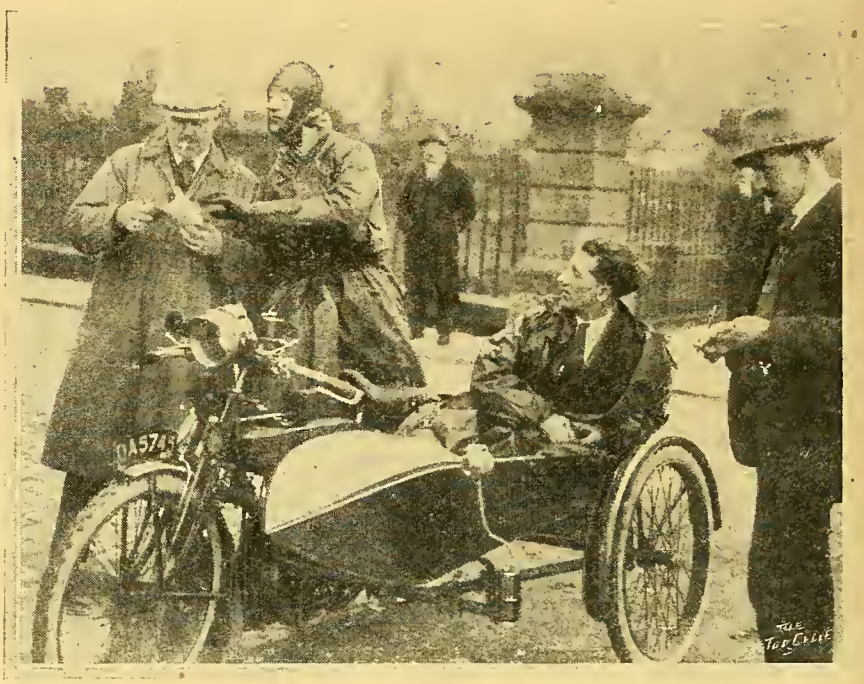
### Youthful Enthusiasts.

J. Bell (7 A.J.S. sc.), who is only fourteen, and his passenger who is rather less, had difficulty in holding their youthful spirits in check. They confided to our representative on the return journey that they thought these trials tame affairs.

Of the thirty-five starters twenty-two finished. The large number of first-class awards is a striking contrast to last year's results, when, with a larger entry, only seven competitors finished. This is accounted for by the exceptionally fine weather. Results :

FIRST-CLASS AWARDS.—F. J. Manning (6 A.J.S. sc.), J. McFadyen (8 Sunbeam sc.), G. T. Templeton (6 Martinsyde), J. Parker (3½ Rudge), J. Lloyd (3½ Norton), G. Gordon (2¾ New Imperial), J. Bell (7 A.J.S. sc.), G. Mann (6 A.J.S. sc.), A. Neilson (7 A.J.S. sc.), R. Watson (6 Martinsyde sc.), D. Skeoch (7-9 Harley sc.), W. Kennedy (2½ Clyno), T. McCreadie (3½ Sunbeam), J. Donaldson (2¾ Royal Scott sc.), G. Hope Wilson (2¾ Barr and Stroud sc.), G. Kelly (2¾ A.J.S. sc.), R. D. Robertson (8 Matchless sc.), F. M. Batxer (G.N.), A. Hunter (6 Ariel sc.), H. G. Deas (2¾ Royal Ruby sc.), A. Robertson (8 Enfield sc.), and B. Gold (8 Blackburne sc.).

PRIVATE OWNERS' SPECIAL PRIZE, for smallest power sidecar outfit (five gallon drum of oil, presented by British oil and Turpentine Co., Ltd.).—H. Gordon Deas (2¾ Royal Ruby sc.).



Geo. Kelly (2¾ A.J.S. sidecar) checking in at Perth during the point to point run of the Glasgow Western M.C.C.

# LONDON-GLOUCESTER-LONDON TRIAL RESULTS.

## Only Five Competitors Retain absolutely Clean Sheets. N.W. London M.C.C. wins Team Prize.

RESULTS, subject to A.C.U. confirmation, have now been issued for the London-Gloucester-London open trial of the North-West London M.C.C.

Five competitors only lost no marks—W. H. Hardman (7-9 Matchless sc.), J. K. Flemons (7-9 Harley- Davidson), S. R. Axford (8 Brough Superior sc.), H. James (3½ Norton), and H. W. Deacon (3½ Norton). The special awards were therefore decided on total time errors at the various checks as follows :

GENERAL CUP.—W. H. Hardman (8 Matchless sc.).

NOVICE CUP.—J. K. Flemons (7-9 Harley-Davidson).

EXPERT CUP.—J. A. Newman (3½ Douglas).

LADIES' CUP.—Mrs. M. Hardee (8 Matchless sc.).

Silver cups for having obtained over 95% of the marks each way were awarded to the following :

G. Baxter (6 Martinsyde sc.), R. Harte (6 Martinsyde sc.), D. F. G. Fitzgerald (3½ Norton), H. James (3½ Norton), H. W. Deacon (3½ Norton), S. R. Axford (8 Brough Superior sc.), E. W. T. Howard (3½ N.U.T.), T. W. White (8 Sunbeam), J. A. Newman (3½ Douglas), R. B. Clarke (8 Matchless sc.), F. W. Stevenson (5 Brough sc.), L. Welch (4¼ B.S.A.), H. W. Holmes (10 Morgan), J. W. Troughton (4¼ X.L.), W. H. Hardman (7-9 Matchless sc.), W. L. Handley (2¾ O.K. Junior), L. P. Walter (4 Triumph), W. E. Line (8-10 New Hudson cycle car), W. Brandish, Jun. (4½ Humber), B. L. Bird (6 B.S.A. sc.), J. S. Walker (6 B.S.A. sc.), J. A. Peacock (8 Matchless sc.), H. Beart (10 Morgan), V. Gayford (3½ Norton sc.), J. K. Flemons (7-9 Harley-Davidson), E. S. Burnett (5-6 Raleigh), W. G. Harding (4 Triumph), R. Pugh (4 Triumph sc.), L. Nicholson (2¾ Omega), Mrs. Hardee (7-9 Matchless sc.), J. C. Mebes (8 T.B .cycle car), A. H. Rowe (10 Morgan), S. S. Barker (3½ Sunbeam), H. Le Vack (7-9 Indian sc.), D. H. Davidson (7-9 Indian sc.), and E. Pond (4 Triumph).

As S. E. Longman (3½ Zenith-Bradshaw) stopped to assist Temple, it is expected that the time he lost would qualify him for a silver cup.

The following were awarded silver spoons for having obtained 90% of marks each way :

J. C. Lowe (4¼ James sc.), S. A. McCarthy (8 Morgan), W. F. Winslow (4¼ X.L. sc.), N. V. Young (4¼ Sunbeam sc.), E. J. Cross (7-9 Harley-Davidson sc.), L. V. Freeman (8 Sunbeam sc.), J. Wallis (7-9 Reading-Standard sc.), F. G. Morgan (2¾ Cotton), C. W. Ramstedt (2¾ Cotton), W. G. Crabb (2¾ Cleveland), G. W. Sheppard (8 L.S.D.), and O. B. Smyth (3½ Sunbeam).

Certificates for finishing the double journey within thirty minutes of the scheduled finish were awarded to the following :

H. D. Cuddeford (5-6 A.J.S. sc.), A. H. S. Love (3½ Norton), J. L. Johnson (4 Triumph), M. R. Gray (3 Coventry-Eagle), A. B. Bourne (2¼ New Imperial), T. Clutterbuck (4 Triumph), R. A. Bull (8 Matchless sc.), D. A. Griffiths (3½ Norton), E. F. Shildon (5-6 Raleigh), M. Pearson (4 Triumph), D. J. Stone (2¾ Orbit sc.), G. E. Cuffe (2½ Metro-Tyler), C. C. Labin (3½ Zenith-Bradshaw), R. P. Purnell (1¾ J.E.S.), and W. Brooke (2¾ Cotton).

### The Winning Team.

The Service Challenge Cup, presented by the Service Co., Ltd., for the best performance of a club team, was awarded to the North-West M.C.C. team consisting of D. F. G. Fitzgerald (3½ Norton), H. James (3½ Norton), H. W. Deacon (3½ Norton), H. D. Cuddeford (5-6 A.J.S. sc.), S. R. Axford (8 Brough Superior sc.), and H. E. K. Sawtell (10 Morgan). The Oxford M.C.C. team was second and the North London M.C.C. third.

### "THE MOTOR CYCLE" IN FRANCE.

Several of our readers in France have drawn our attention to the fact that they are being overcharged for their copies of *The Motor Cycle*. In cases where more than one franc sixty centimes is charged, will readers please send to the publishers, Iliffe and Sons Ltd., Dorset House, Tudor Street, London, E.C.4, particulars of the name and address of the newsagent?

# The London-Exeter Results Summarised.

## Analysis of Official List of Awards. Only 15% Retirements Despite Severe Conditions.

OF the 275 intrepid riders who competed in the 1921 London-Exeter London twenty-four hours run, over 56% secured gold medals over 23% silver medals. A little over 15% retired, and the difference is made up by those who finished but failed to qualify for any award and those who were disqualified (usually through being *ahead of time* at the secret check).

### Percentages of Retirements.

Taking the various classes of vehicles separately, the cars head the list with only 7.8% retirements, three-wheelers come next with 13.3%, sidecars 17.7%, and solo machines 23.4. At first sight the last mentioned figure appears unduly high, but it must be remembered that conditions were very much against the single track machine.

From the point of view of reliability, the majority of those who were disqualified should be considered in a favourable light, as in most cases disqualification was due to their being too early at the secret check, while in a few cases lamp troubles caused loss of awards. In one case only was disqualification due to any point in connection with replacement of a broken part in a control.

### Popular Trials Machines.

As regards the performance of different makes of machines of which more than three were entered, the following figures are of great interest :

| No. of machines which started. | Gold medals. | Silver medals. | Also finished. |
|---|---|---|---|
| 23 Matchless .. | 20 | 2 | 0 |
| 13 Triumph .. .. | 5 | 7 | 0 |
| 11 Morgan .. .. | 5 | 5 | 0 |
| 9 Sunbeam .. .. | 3 | 2 | 0 |
| 8 A.J.S. .. .. | 4 | 3 | 0 |
| 7 Harley-Davidson | 6 | 0 | 0 |
| 7 Zenith .. .. | 5 | 1 | 0 |
| 7 Brough Superior | 5 | 0 | 2 |
| 7 Douglas .. .. | 1 | 2 | 2 |
| 6 Martinsyde .. | 5 | 0 | 0 |
| 6 Norton .. .. | 4 | 1 | 0 |
| 5 A.B.C. .. .. | 1 | 3 | 0 |
| 4 Indian .. .. | 3 | 0 | 0 |
| 4 Rudge .. .. | 2 | 1 | 0 |
| 4 Scott .. .. | 2 | 1 | 0 |
| 4 Quadrant .. | 0 | 1 | 1 |

As will be seen from the following percentage tables, the cars also gained the highest percentage of gold medals, sidecars were next, and the solo machines just led the three-wheelers. However, only fifteen three-wheeled cycle cars started.

### THE RESULTS AT A GLANCE.

297 entries.
275 started.
155 gold medals (56.36%).
64 silver medals (23.2%).
3 no awards.
10 disqualified
43 retired (15.6%).

### How the Solo Riders Fared.

72 entries.
64 started.
26 gold medals (40.6%).
20 silver medals (31.2%).
3 disqualified.
15 retired (23.4%).

### The Sidecars.

110 entries.
107 starters.
56 gold medals (52.3%).
26 silver medals (24 3%).
1 no awards.
5 disqualified.
19 retired (17.7%).

### Three-wheeled Cycle Cars.

18 entries.
15 started.
6 gold medals (40%).
6 silver medals (40%)
1 no awards.
2 retired (13.3%).

### Cars.

97 entries.
89 started.
67 gold medals (75.2%)
12 silver medals (13.4%)
1 no award.
2 disqualified.
7 retired (7.8%).

## The Competitors' Machines Alphabetically Arranged—How They Fared.

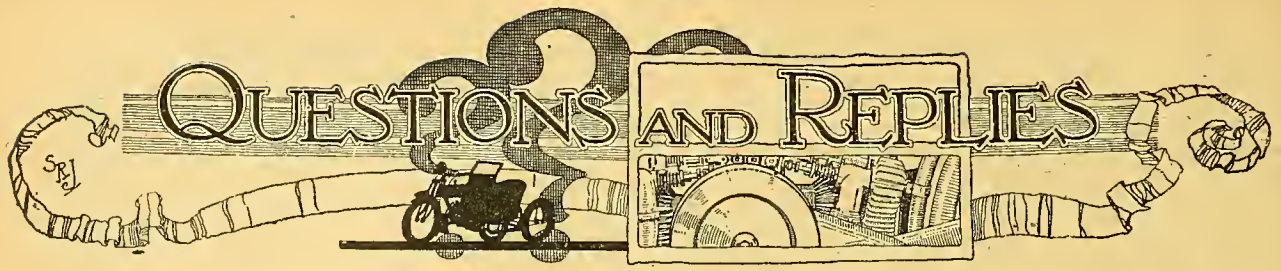
* Too early at secret check. † No lights.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the top left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

ROUTES.—By special arrangement with the Automobile Association and Motor Union, readers of "The Motor Cycle" desiring routes may enjoy the benefit of the Road Service Department of that organisation. Queries should be addressed to the Editor in the ordinary way (enclosing a 2d. stamp), and will be dealt with by the A.A. and M.U., who are regularly in receipt of reports from their representatives all over the country as to the existing state of the roads in any particular locality.

### BELT DRIVE FOR A STATIONARY MACHINE.

I require a good, strong belt, ⅝in. groove, speed about 750 feet per minute, load 1 h.p. at most. This is for commercial use, running eight hours per day. Are there any makers of belts for motor cycles likely to be satisfactory for my purpose, and will the grooved pulleys require to be specially made?—J.H.

Either the Whittle or Forward makes of combined leather and steel link belting should answer your purpose. It is necessary to use grooved pulleys with an included angle of 28°.

### SWIVELLING AND TILTING HEAD LAMPS.

Why does the law require motor cycle head lamps to be so constructed, fitted, and attached as to prevent vertical movement, or use as a searchlight, of the light exhibited by the lamp, and does the same apply to motor car head lights?—H.S.

There is no law such as you outline. You are apparently referring to one of the Defence of the Realm regulations, which was only enforced during the war. So far as cars are concerned, head lamps must be fixed rigidly. They are not permitted to be swivelled with the steering, etc.

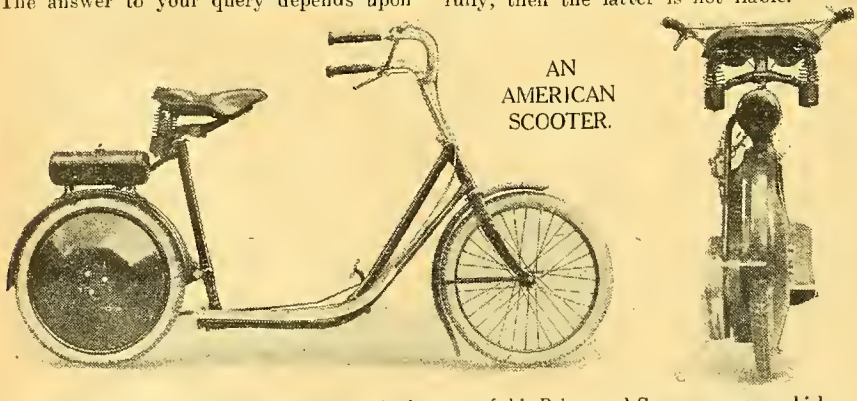
### THE RIGHTS OF THE DOG.

Will you kindly inform me if a motor cyclist is liable at law for killing a dog (or even injuring it) with his machine on the public highway?—F.S.T.

The answer to your query depends upon whether there is negligence on the part of the motor cyclist or not. A dog has a perfect right to be on the highway, and a motor cyclist must proceed sufficiently carefully to prevent any injury to it; but if the dog rushes across the road suddenly while the motor cyclist is riding carefully, then the latter is not liable.

## Important Dates.

**Fri., Jan. 27th, to Sat., Feb 4th—Scottish Car and Motor Cycle Show.**
**Sun., Mar 5th—Argenteuil Hill-climb (France).**
**Mon., Mar. 6th—La Turbie Hill-climb (Nice).**
**Wed., Mar. 15th—A.C.U. One-day Trial for Stock Machines.**
**Thurs., Mar. 23rd—East Midland Centre A.C.U. Open Reliability Trial.**
**Sat., April 1st—Western Centre A.C.U.—Open Hill-climb.**
**Sat., April 8th—B.M.C.R.C., Members' Meeting at Brooklands.**
**Fri., April 14th, and Sat., April 15th—M.C.C. London-Land's End Run.**
**Sat., April 22nd—N.-Eastern Centre A.C.U. Open Reliability Trial.**
**Sat., April 29th—S. Midland Centre A.C.U. Open Hill-climb.**
**Mon., May 1st, to Sat., May 6th—Scottish Six Days Reliability Trials.**
**Sat., May 13th—Northern Centre A.C.U. Open Reliability Trial.**
**Sat., May 20th—S.-Western Centre A.C.U. Open Reliability Trial.**
**Tues., May 30th—Junior Tourist Trophy Race.**
**Thurs., June 1st—Senior Tourist Trophy Race.**



AN AMERICAN SCOOTER.

Simplicity and cleanliness of design is the keynote of this Briggs and Stratton scooter, which is fitted with a 2 h.p. four-stroke engine. It is claimed that 100 m.p.g. can be obtained with the machine which, fully equipped, weighs but 110 lb.

### ENCLOSING A CHAIN.

I am making a chain case (oil bath) for the engine chain of my 4 h.p. Blackburne motor cycle, with Sturmey-Archer gear box. Will it be necessary to put oil channels on the top half where the flywheel leaves and the gear box shaft enters the gear box to stop the oil being thrown about? If so, can you suggest a suitable way of making them, as there is very little room?—C.B.

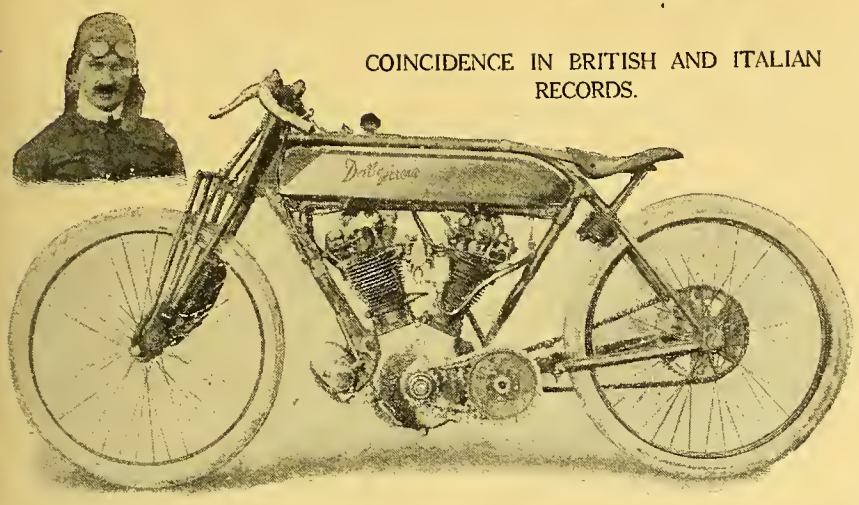
We are not quite clear as to your query, and imagine that you are embarking upon a very difficult undertaking in endeavouring to make an oil bath chain case for use in conjunction with the Blackburne engine and Sturmey-Archer gear box. Neither of these units lends itself to oil bath protection of the primary chain, especially if the final transmission is by belt; the clutch, moreover, is not intended to run in oil.

### CHANGING A CYLINDER.

Would you kindly answer a few questions concerning fitting a Triumph cylinder to (I believe) a 1914 Premier motor cycle? The one I have on at present is, of course, a Premier cylinder with auxiliary exhaust valve. I have experienced trouble with the exhaust valve seating. It has cracked twice, and each time I have had it welded, but it has cracked again for the third time. (1.) The h.p. is 3½; the bore and stroke are 85×88 mm. Could I fit a 1913 Triumph cylinder with a bore and stroke of 85×88 mm.? (2.) Would the valve stems come in line with the tappet rods? (3.) Would the stud holes at the foot of the cylinder come in line with the studs on the crank case? (4.) Should I have to fit a new piston?—T.V.D.

(1.) We believe that with a little ingenuity you could fit a 1913 Triumph cylinder to your 1914 Premier engine. (2.) We cannot give you any detailed information regarding the conversion, but if the valve stems do not come in line there will be no objection to fitting tappets with very large heads. (3.) The studs might require some adjustment, but we do not think there will be any great difficulty. (4.) If possible, it would be advisable to fit a Triumph piston for use with the Triumph cylinder, but you should take care that it is the same weight as the piston which is removed. If the Premier piston is the same height above the gudgeon pin as a Triumph piston, there would possibly be no need to change, as the compression ratio would approximately be the same.

## COINCIDENCE IN BRITISH AND ITALIAN RECORDS.



By a curious coincidence, Frederico Della Ferrera (inset), on the above o.h.v. twin bearing his name, recently set up an Italian mean speed record for the flying kilometre in the 500 c.c. class in exactly the same time as R. N. Judd's Brooklands record on a Norton. The two Italian times were 26·2 sec. and 25·6 sec. = 25·9 sec. mean speed = 86·37 m.p.h.

### GEAR RATIO FOR SPEED EVENT.

Are the following figures correct to give a 3 to 1 top gear: Size of belt drum, 17½in.; size of belt pulley, 7in.; number of teeth on the driving sprocket, 40; and number of teeth on the engine sprocket, 34? Will this be a suitable gear for a 2¾ h.p. two-stroke with the engine tuned up for a speed test on the level? If not, please give your opinion as to the most suitable gear ratio to be used.—J.W.

The dimensions which you give are correct for a gear ratio of 3 to 1. This ratio would be most unsuitable, and we do not recommend you to gear higher than 5 to 1. On this gear the engine, if in perfect condition, should give up to 50 m.p.h.

### ACCUMULATOR LIGHTING.

Thinking of changing over from acetylene to electric lighting (accumulators), I should like to know: (1.) How do accumulators stand up on a 4¼ h.p. solo machine as regards length of service. (2.) What capacity would be required? I do from half to one hour daily after dark, and desire a light equal to that obtainable from the best acetylene lamps.—T A 250.

(1.) Any good accumulator should stand up quite well on a 4¼ h.p. solo machine, but we do not recommend that you carry it on the handle-bars. It is best firmly clamped to the saddle tube of the frame. (2.) In order to get a light approaching what you require, the head lamp should have a 6-volt 3 amp. bulb (for the tail lamp 6 volt .2 amp. would be sufficient), and to maintain these bulbs it would be necessary to use a 6 volt 20 amp. (lighting) accumulator. This size would be fairly bulky and heavy, and the maximum duration of lighting from one charge would be approximately six hours (probably rather less). It would therefore be advisable to use a dynamo so that the size of the battery might be cut down somewhat.

### FITTING OVERSIZE TYRES.

Being anxious to fit oversize tyres (3in. if possible) to my 1919 4 h.p. Douglas, I wrote to two or three tyre companies and asked their advice. I said that, as supplied, the machine had 26 × 2⅜in. tyres on 26 × 2⅜in. rims. But I was assured by two tyre companies that, in reality, the rims were 26 × 2¼in. D2. Which is right, and what does the D2 stand for? I also notice in the lists rims whose sizes are shown as D1, D2, D3, CC1, CC2, C1, C2, OS, C3, B7, B8, and so forth. Will you be so kind as to explain these terms? Also, what is the approximate size, in inches, of the 650×65 mm. tyre?—G.B.

The rims fitted to the 4 h.p. Douglas machines are the British standard size D2, and will take 26 × 2¼in., 26 × 2⅜in., and 26 × 2½ × 2¼in. tyres. All these sizes are made for the B.S.D2 rim; but you will also find that it is possible to fit the majority of 28×3in. covers on the same rim, as many riders have described in our pages. You will find a full list of standardised rim dimensions in "Motor Cycles and How to Manage Them." The 650×65 mm. size equals 26×2½in.

### AN OLD TWO-SPEED HUB

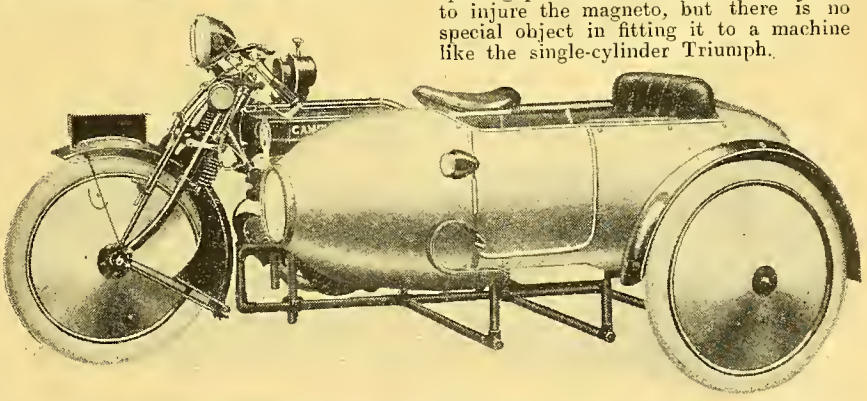
I have recently become possessed of a rather old type of Matchless twin, fitted with a Roc two-speed gear, pedal start. The engine runs very well indeed, but the Roc two-speed is a little bit uncertain, and the wheel itself wobbles quite a lot. Can you tell me where I can procure a booklet or any information on the working of this gear which will help me in making it efficient?—NOVICE.

It is now almost impossible to get a booklet dealing with the Roc two-speed gear. We should imagine, however, that the gear fitted to your machine is not a Roc, but a Vindec, which was standard with early Matchless machines. You can easily tell whether this is so by the controls. The Roc is controlled entirely by pedals—one for the high gear, one for the low gear, and one for the brake—and has a live axle with projecting dog for handle starter. The Vindec is controlled by a large hand lever working in a long notched quadrant at the side of the tank; it has a free-wheel for starting by means of pedalling gear.

### HIGH SPEED FROM A TOURING MACHINE WANTED.

(1.) What would be the best timing for the valves of a 1918 4 h.p. Triumph for speed? (2.) What is the best sort of cam to use—quick opening and closing, quick opening and slow closing, or slow opening and quick closing? (3.) Would it be advisable to advance the spark further than standard? (4.) Would these alterations greatly inconvenience running in traffic? (5.) Is it advisable to fit a spark intensifier consisting of a spark gap in series with the high-tension terminal? Is it likely to injure the magneto?—R.C.H.K.

(1, 2, and 3.) Your questions involve a great deal of experimenting, and it is impossible to lay down any hard and fast rules for obtaining speed. In any case, your machine is not of a type primarily designed for speed work, and it is very doubtful whether you can attain your object without going to considerable expense. Carefully tuned, and using standard parts only, 55 to 58 m.p.h. might be attained. (4.) The running of the machine might not be nearly so pleasing in traffic, etc. (5.) A spark gap, if not too wide, is not likely to injure the magneto, but there is no special object in fitting it to a machine like the single-cylinder Triumph.



A streamline sidecar embodying an electric lamp at the nose. This smart aluminium body was made by Mr. C. E. Norris, Trent Bridge, Nottingham.

### CHOOSING A HILL FOR A SPEED CLIMB

It is our intention to hold a climb in the near future for a few (approximately thirty) of the local would-be speedmen. This climb is, of course, not in connection with any club, but merely a sporting run for some sporting machines, over which the owners have occasional hot words. The information we require especially is under the following headings: (1.) What is a suitable hill as regards gradient, surface, and length? (2.) What police regulations are there, and what are the means of obtaining police permission, if necessary? (3.) What is a good but simple method of timing? (4.) Over what distance are competitors usually timed? (5.) What distance is usually allowed for a flying start? Our district is purely agricultural, and therefore we think there should not be many difficulties in our way.—M.D.S.

(1.) *(a)* Gradient is a matter for choice—the steeper the better; *(b)* the surface should be as smooth as possible; *(c)* half a mile or one kilometre. (2.) Actually any competition which involves speeds above the legal limit of 20 m.p.h. is illegal if held on a public road. The best thing to do is to obtain police permission from the Chief Constable of your district. (3.) The simplest method of timing (presuming that you cannot use a portable telephone between the starting and finishing of points) is to have the timekeeper at the finishing line, in such a position that he can keep the starter in sight. If the starter uses a flag, the timekeeper can start his watch at the fall of the flag, and stop it as the competitor crosses at the finishing line. (4.) The distance depends upon the hill—usually half a mile or one kilometre; sometimes it may be one mile, or even more. (5.) About two hundred yards.

### CONVERTING TWIN MAGNETO TO SINGLE.

I have an ex-W.D. twin-cylinder Thomson-Bennett magneto which I am converting for use with a two-stroke single-cylinder engine. I have already removed one carbon brush and both cams, and I am fitting a new cam of 200°. (1.) In what position should this cam be fitted in relation to contact breaker? (2.) Should the contact points open the same time as the carbon brush enters on to the brass segment on slip ring, and remain open until the brush has passed over the whole length of this segment, which you will note only circuits about half of slip ring? In other words, should the period of open points be at the same time as the period of brush passing over brass on slip ring?—A.G.

(1.) Your best plan is to fit the new cam so that its leading edge coincides with the position previously occupied by the leading end of one of the cams which you have removed. (2.) The brass segment of the slip ring should be under the fibre brush when the contact points open, but there is otherwise no exact position for duration of this period, as its only function is to provide a path to the carbon brush when the current flows.

## READER'S REPLY.

### BLACKING CYLINDERS.

*Re* "J.H.R.'s" query on blacking cylinders, which occurs on the "Questions and Replies" page of your issue of December 29th. May I be allowed to state that a white surface is a good reflector, both of heat and light, but a very bad radiator, a black surface being by far superior as regards radiation. Good absorbers are also good radiators.—WELLERSSET.

## EXPERIENCES WANTED.

*Readers' replies to questions published under this heading should be addressed c/o the Editor, when they will be forwarded direct to the querists concerned.*

"Beginner" (Merton).—2¾ h.p. Douglas, 1921-22: Speed, running costs, and reliability on long journeys.

"A.D.P." (Baldonnel).—1921 A.B.C.: Reliability when modified, modifications and improvements recommended, valve gear noise, and largest tyres that can be fitted.

"E.B." (Manchester).—Best mechanical pump on 4 h.p. Triumph, m.p.g., oil consumption, and best setting of adjustment.

"L.G.J." (Herne Hill).—4¼ h.p. B.S.A. sidecar, chain drive, compared with Carden, A.V., or Tamplin cycle car; is B.S.A. sidecar preferable to other proprietary make?

"G.A.H." (Birmingham).—1921 8 h.p. Enfield (Vickers engine): Consumption, speed, climbing, control of gear in traffic, lubrication, and cooling.

"C.P." (Clapham, S.W.).—7 h.p. four-cylinder F.N.: Reliability, accessibility for tyre and mechanical repairs, consumption (solo), liability to skidding compared with other solo machines.

A Norton rider, H. F. Fellowes, above Lyme Regis.

## SPARKLETS

### Calendars for 1922.

We have to thank the following firms for sending us their very artistic calendars: The British Piston Ring Co., Ltd., Abdulla and Co., Ltd., Brown Brothers, Ltd., Shell-Mex, Ltd., Philipson and Co., Ltd. (Bolton), and Henderson Sidecars (Sheffield).

### Carriage Paid.

Most motor cycle manufacturers are now sending out their machines carriage paid to any part of England, Wales, or Scotland. Humphries and Dawes, Ltd., of Hall Green, Birmingham, advise us that O.K. machines will be delivered free of all carriage charges to any part of Great Britain.

### Melbourne-Sydney Record.

The road record from Melbourne to Sydney, which stood at 23h. 41m., was broken by H. R. Hodgson, of Sydney, just before Christmas. Riding a 7-9 h.p. Harley-Davidson with Dunlop tyres, he accomplished the journey in 18h. 11m., averaging 31 m.p.h.

### Fixing 1922 Prices.

In order to stabilise the market as far as possible, there will be no change during 1922 in the prices of the electrical equipment and accessories manufactured by A. H. Hunt, Ltd., of Croydon. An announcement to this effect was made at the recent Olympia Show.

### Catalogues Received.

Coventry Eagle Cycle and Motor Co., Coventry: A catalogue of thirty-two pages, well illustrated, and showing the complete range of Coventry Eagle motor cycles.

Stanford Sidecar Co., Sampson Road North, Birmingham: Giving essential details of the Stanford sidecars and the Universal windscreen.

County Cycle and Motor Co., Broad Street, Birmingham: Folder describing the County B.S.A.-Canoelet taxi-sidecar outfit, giving prices, estimated running costs, and similar figures of use to those contemplating establishing a sidecar-taxi business.

James Grose, Ltd., 4, Old Jewry, Cheapside, London, E.C.2: A very comprehensive accessories catalogue containing practically everything for the motor cycle, and incorporating several new lines. A supplementary sheet has been issued, which shows great reductions in prices, and anyone already possessing the catalogue may have one on request.

Hazlewoods, Ltd., Albion Mills, Coventry: Folders describing and illustrating the various Hazlewood machines. For 1922 new prices are announced, the 2¾ h.p. J.A.P.-engined model being offered at £67, and the 6 h.p. sidecar outfit at £118, the latter being a surprisingly low figure in view of the excellent specification.

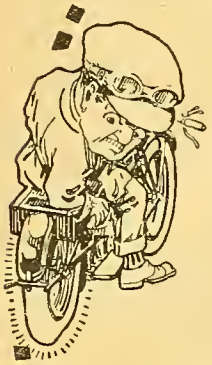
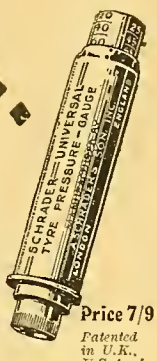
# Keep Your Tyres in Tune —





PNEUMATIC tyres (and tubes) are made to give the greatest efficiency for a given weight and pressure. Unless you ensure and maintain the *known* pressure, your tyres will not give the mileage and efficiency for which they are designed.

"Schrader Universal" Tyre Pressure Gauge enables you to test the air pressure in your tyre quickly, and assures you an appreciable difference in the "tune" and running costs of your motor cycle.

Table of Correct Air Pressures for all well-known makes of tyre will be sent post free on application.

## SIMPLY A MATTER OF PRESSING THE BUTTON—

THE RUNBAKEN Spark AMPLIFIER AND TESTER ! !
(Patd. 13980)

This highly finished accessory is quickly fitted to any type of plug, and with its aid, besides giving the generally recognised advantages of an extra spark gap in the high tension current, has also the following advantages :

1. Confirms Magneto and High Tension Wire O.K.
2. Definitely enables you to see a spark take place at Plug Points.
3. Whether sparking regular or not.
4. Whether points sooted or insulator cracked.
5. Indicates "shorted" Plug.
6. Will cut out cylinder for testing purposes.
7. Acts as thief-proof device.
8. Never necessary to take out Plugs except when faulty.

GET IT AT

# TAYLORS

Sole London & District Distributing Agents for A.J.S., British Excelsior & Dunelt Motor Cycles.

## This customer's problem may be yours!

A Prospective customer in writing to us for advice on the purchase of a motor cycle, makes this statement:

*"I am afraid to advertise for fear of having some awful dud unloaded on me, as I am not an expert."*

This customer's problem may be yours, and if so, solve it in the same sensible way that he has done—write to us for advice concerning the best type of Motor Cycle, Combination, or Light Car to suit your particular needs.

Remember, a firm like Taylors, with a 12-year reputation for honest trading to maintain, can't afford to jeopardise it for some small immediate gain.

Our stock is one of the most comprehensive in the country, and includes all the new-comers that are good as well as the old favourites of established reputation.

Here are some examples.—

# PHILIPSON'S

PATENT AUTOMATIC GOVERNOR

# PULLEY

AND GEAR COMBINED.

# Philipson's Latest!

## GOVERNOR PULLEY AND VARIABLE GEAR COMBINED WITH FLY WHEEL for all two-stroke engines.

**The Lightest, Speediest, and Simplest Gear on the market for direct belt-driven 2-stroke and 4-stroke engines.**

ONLY adds 2 lb. (approx.) to the weight of a 2-stroke machine, and 6 lb. (approx.) to the weight of a 4-stroke machine.

During the past week we have fitted the following machines:

| 2-stroke. | 4-stroke. |
|---|---|
| LEVIS, | TRIUMPH, |
| O.K., | NORTON, |
| CALTHORPE, | ROVER, |
| VILLIERS, | SINGER, |
| etc. | COULSON-BLACKBURNE |

**We are now in a position to supply the Philipson Pulley to fit J.A.P. engines without any alteration to the machine or "staggering" of the engine.**

Our Flywheel Governor converts a single-speed 2-stroke into a speed model —*the lightest speed model on the market!*

THE ONLY GEAR WITH NO END THRUST.

IMMEDIATE DELIVERY.

*Send for Illustrated Booklet:*

**No gear box friction.**
**No grinding noises.**
**No wheels or pinions to chew up.**

*What is your make? Write us*

REDUCED PRICE **£7 7 0** Carriage Paid.

THE

# READING-STANDARD

## AGAIN LEADS THE WAY!

In the strenuous LONDON-EXETER Trial a READING-STANDARD with PLUS-ONE sidecar, carrying, in addition to the driver, TWO ADULT PASSENGERS, finished dead on time, gaining SILVER MEDAL (subject to confirmation).

THINK THIS OVER! THREE adults carried with perfect safety and ease over the entire distance, notwithstanding the dreadful weather encountered. Is there anything that the ordinary rider, under average conditions, can ask of his machine comparable to this? We believe that this is the first time in motor cycling history that such a feat has ever been attempted! Let your 1922 mount be a READING-STANDARD, you will then know what motor cycling joy really is.

**(1) SOLO** Complete with dyoamo lighting, electric horn, all lamps, pump, tools, 3 months' guarantee .. .. .. **£135**

# YOU GET EASE of MIND and BODY

*when riding a Coulson because of its four virtues.*

Coulson

FOR COMFORT

RELIABILITY

SAFETY

SPEED

**Your MIND is at rest—**

1. Because you know that the frame and fittings, made by A. W. Wall, Ltd., of Tyseley, Birmingham, the firm with the *longest* experience in the motor cycle industry, have a reputation for rock-like durability.
2. Because you know that your power unit is a Blackburne—the engine with the classic reputation, both for reliability and speed, *and* for ease of control.
3. Because your Coulson is fitted with TWO Webb internal expanding hub brakes, which having demonstrated their efficiency throughout three seasons A.C.U. Six-day Trials, etc., are proof against *any* emergency,

and

**Your BODY is at rest—**

1. Because you have real "comfort in the saddle," due to the unique Coulson *leaf-springing* over the back wheel, which gives complete insulation from all road shock.
2. Because you have "leaf-springing" in the front forks giving equal comfort in the arms and shoulders.
3. Because the above unique springings are in their action assisted by the most comfortable of saddles and the most resilient of tyres.

You have only to run a Coulson on a *really bad* road to realise its surpreme superiority over all other makes. It is undoubtedly the most comfortable motor cycle in the world.

*Send for particulars to the Sole Concessionnaires.*

DOUGLAS 2¾h.p., 1917, excellent condition, fully equipped, licensed; exchange higher power.—17, Sussex Rd., New Malden, Surrey. [4086

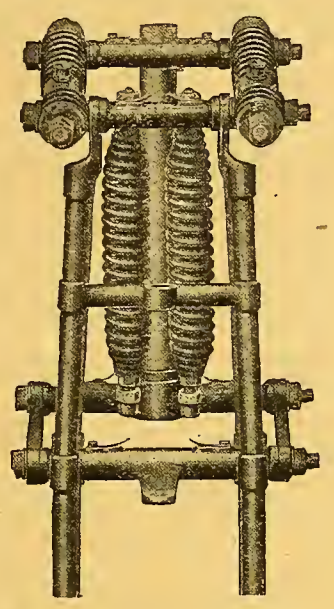
SPORTING Monocar, 3-wheeler, discs, absolutely reliable, good tyres; trial; exchange motor cycle; sell £39.—3, Addiscombe Grove, Croydon. [4388

HALIFAX.—50 second-hand machines and combinations; keen exchanges; get list.—Halifax Motor Exchange, Horton St., Halifax. [4019

RUDGE Multi, I.O.M., 1920, unpunctured, speedometer, tax paid, and cash, for A.B.C., Scott, 3-speed Douglas.—A., 6, Essex Grove Walthamstow, E.17. [4095

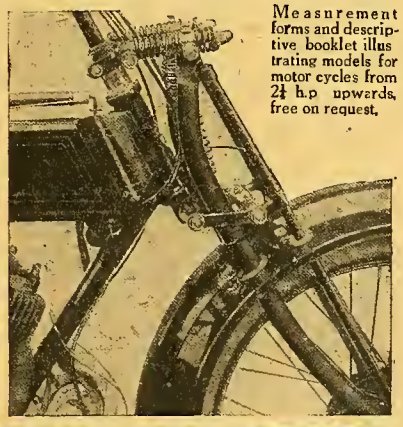
The BRAMPTON

Bi-Flex SPRING FORK



SINCE a spring Fork can only absorb vibration and shocks effectively in the direction in which it is capable of movement, the liberal margin of movement in both the horizontal and vertical planes which the exclusive design of the Brampton Bi-Flex facilitates, will be readily appreciated. The Brampton Bi-Flex Spring Fork is instantly responsive to, and completely absorbs within itself, all vibration and shocks from every angle at which resistance is encountered, rendering the rider immune from discomforts which are otherwise impossible to entirely eliminate.

BRAMPTON BROS., Ltd.,
Oliver Street,
BIRMINGHAM.



Measurement forms and descriptive booklet illustrating models for motor cycles from 2¼ h.p upwards, free on request.

## EXCHANGE.

1920 7-9h.p. Indian Solo, perfect condition, for 8h.p. sports Zenith or single (Blackburne engined).—B. P. Jackson, 2, East View, Preston. [3856

RUDGE Multi, 1920, scarcely used, complete with all accessories; exchange lightweight and cash, or sell £65.—198, King St., Hammersmith. [4067

## A Lightweight T.T.

WE congratulate the Auto-Cycle Union upon its decision to recognise officially the 250 c.c. lightweight as deserving a Tourist Trophy of its own. Our interest in this type of machine is well known. Before the war we urged that the smaller type of motor bicycle was capable of great development as a solo mount, and that improvements in design had paved the way for a general reduction in engine size. For example, a few years ago the single-cylinder motor cycle of 500 c.c. was regarded purely as a solo mount, yet in a very short time it became the most popular sidecar type. It is not unreasonable to suppose that any machine capable of propelling a sidecar at average speeds in excess of the legal limit has a reserve of power, when used for solo riding, considerably in excess of the average rider's demands. The advent of the 350 c.c. brought into existence a very popular type of solo mount, which, in turn, has been proved capable of sidecar work. Hence the introduction of smaller machines for solo riding was desirable, but to be developed properly they needed encouragement.

Such encouragement was given by this journal at a time, too, when the governing body was endeavouring to exploit the scooter. *The Motor Cycle* Cups, first offered in 1914 and presented for the 1920 and 1921 T.T. races, focussed attention upon the 250 c.c. lightweight, and assisted materially in fostering their development. In 1921 the tiny four-stroke lightweight which won the cup was 6½ m.p.h. faster than the winner of the previous year's 250 c.c. trophy—a two-stroke incidentally.

In a leading article early in 1919 we said: "In this type of machine (the 250 c.c. mount) we see the motor cycle for the million." In repeating our offer for a trophy for 250 c.c. machines, we stated that "there are no better means of developing the small engine and light machine than the conditions imposed during a long run at speed over a T.T. course.

"Because the small lightweight *is* the most suitable and most promising machine for 'the million,' a tertius class T.T. has a strong claim upon the governing body, and we appeal for the inclusion of this suggested class in the next T.T."

The new trophy will mean that each type of solo machine (250 c.c., 350 c.c., and 500 c.c.) has now a Tourist Trophy, and that the true lightweight, last year designated by the A.C.U. as the "flyweight," will receive the same honours for its victories as the larger machines, being treated independently instead of as a subsidiary class in the Junior race.

## The Outlook.

REPORTS reach us from many quarters of a general improvement in trade. So far as the motor cycle industry is concerned, undoubtedly there are signs of increased activity, which, of course, is to be expected at this time of the year. The stabilisation of prices and the very apparent interest in motor cycles, at no time greater than at present, augurs well for the increased demand for motor cycles during this year. The easing of the political situation, too, tends to improve matters.

The motor cycle has now reached a stage where the general public is no longer sceptical regarding its reliability, while its economy is now so well known that on this score alone it is being taken up by those who have hitherto spent a great deal of money in railway travelling.

For light delivery, also, is the economical motor cycle being appreciated by tradesmen who now realise that the possibility of being able to deliver their customers' orders promptly is a valuable business asset.

With the advent of dry roads and the irresistible call of spring, demand is likely to gain impetus as the weeks roll by. At the moment prompt delivery can be effected in most cases, but these conditions will not obtain under an improved and sustained demand.

An index to the advertisements in this issue will be found on the page facing the back cover.

# OCCASIONAL COMMENTS

BY "IXION"

## Help!

WHEN I was a boy at school one of the forms of torture inflicted upon me was termed a "general knowledge paper," which made its annual appearance the week before Christmas break-up. It contained such questions as "How many legs has a centipede, an armadillo, a stevedore, a caterpillar?" etc., etc. I have just sent the headmaster a letter which will inspire a teaser for his next stunt in this line. The question will run, "What kind of engineer handles on the same working day railway communication cords, sparking plugs, corset springs, golf ball moulds, motor 'bus manifolds, carburetter needles, airship control valves, metal boot trees, and railway signal rods?" There is only one right answer—a *rustproofer*. Easy when you know the answer, isn't it?

## Assembled Machines.

ONE or two readers have completely misunderstood my remarks of December 22nd on "assembled" machines, doubtless because I flung them against a background of motor cycling opinion, which apparently does not exist as universally as I supposed. The background in this case consisted of a criticism widely passed on the last Olympia Show by many *cognoscenti*, to the effect that "there were far too many assembled machines!" I accepted the fact underlying this criticism, viz., the multiplication of motor cycles sharing proprietary engines, gear boxes, forks, and the like; and proceeded to analyse it in the spirit of the advocate who defends a burglar. I noticed that the assembled machine is usually *cheaper* than a special design of similar rating; that it is often easier to obtain spares for it locally; and that it is easier for a fussy purchaser to get his personal fads incorporated in it. All of which is true. I did not think it needful to stick up for the superior merits of the special design, supposing that a buyer can afford to pay for one. Apparently, I ought to have put in a word for the householder as well. I do so; gracefully, if tardily. Please note that I did *not* say that the assembled 'bus is better than the special design, or that it can ever be quite so good.

## Gratitude and History.

THE Triumph Co. consider that the special design offers the buyer the three advantages which I claimed for the assembled machine. If it is a machine with output and service on the Triumph scale, it meets my second point, though I cannot agree that it is generally so low-priced, or that its specification is so readily varied—if I tried to get the Triumph people to sell me a Ricardo model with a Jardine four-speed gear, I expect I should get a frozen stare. Nor do I wholly agree with them on the "employment of brains" business—some of the big assemblers utilise a greater sum total of brain-power than any single factory can employ, for they tap the cerebella of half a dozen concerns. I should phrase the superior claims of the special design quite differently from the letter which appears elsewhere in this issue. I should begin by heartily endorsing the view that the older special design factories are the Mons Star men of the motor cycle industry, and, as such, have an imperishable claim on the gratitude of motor cyclists, whereas the assemblers are late 1918 conscripts by comparison, who came in when all risk was ended. But the main charm of the special design in my eyes is not mentioned in the Triumph defence of it.

## Something Different.

SPEAKING as a not untypical motor cyclist, whenever my purse permits it I plump for "something different." Something different from what I rode in 1921, 1920, 1919, 1914, etc. Something different from what my neighbours and fellow clubmen ride. In addition, funds consenting, I like the best in each class. Some of the proprietary engines, gear boxes, etc., are of the very first quality. But, even if one felt neither gratitude for the firms which kept the industry alive in its darkest days, nor interest in the epoch-making innovations which occasionally appear—Douglas, Scott, A.B.C., Barr and Stroud, etc.—the mere zest for variety would link all well-to-do motor cyclists to one or another of the special designs. To sum up, the rider who likes top quality plus variety buys a special design, and changes his make most seasons. The man who likes top quality but cannot afford variety usually buys a special design, and sticks to it. The man who cannot afford either of these ideals usually goes over the list of "assembled" machines with a fine toothed comb, and gets something very good, but not quite so interesting, at a correspondingly lower price.

## Mr. Norton in South Africa.

SOME interesting snapshots just to hand remind me that Mr. J. L. Norton is at present on a business ride through South Africa, and I was much interested to inspect the prints of this wise veteran surrounded by ostriches and cannibals and other tropical fauna. He has already cabled home to the works for various modifications to be introduced into the export model Nortons, and there is no doubt that his policy is excellent. If the big noise from all our factories were personally to sample overseas conditions and collogue with overseas riders, we would annex a far larger slice of the colonial trade. Mr. Norton belongs to the tough old breed whom we don't raise nowadays. He has been a greybeard ever since I have known him (I don't care to add up how long that is), and it is vastly to his credit that at his age he should tackle so exhausting a trip.

## About Spares.

OCCASIONALLY we receive a peevish letter from some reader who considers that he has been overcharged for a spare part. As a rule his grievance peters down into sheer ignorance of the "overhead" expenses, which augment the cost of spare part service—the locked up capital, the staff, rates, and repairs of the stores, and the like. But of late I have noticed a novel technical element which tends to increase the price of spares. Cheap production is the parrot cry of the day. A few years ago many component items of a motor cycle were, so to speak, bent up in the shops, or otherwise demanded a large amount of skilled labour. To-day labour, being a costly item, is cut down to the minimum; there is a marked tendency to employ dies and to stamp or press as many parts as possible. Dies are expensive, and the production expert tries to make one die do the work of two. So we get such items as a combined sprocket and brake drum. The system undoubtedly cheapens production, but it often adds to the cost of maintenance. To quote actual examples, a friend of mine found at his winter overhaul that his rear sprocket teeth were too badly worn for further use. He ordered a spare. Thanks to its being combined with the brake drum, it cost him £3, instead of the 25s. which he had estimated; this although his old brake drum was still fit for an unlimited mileage.

## Designing for Cheap Maintenance.

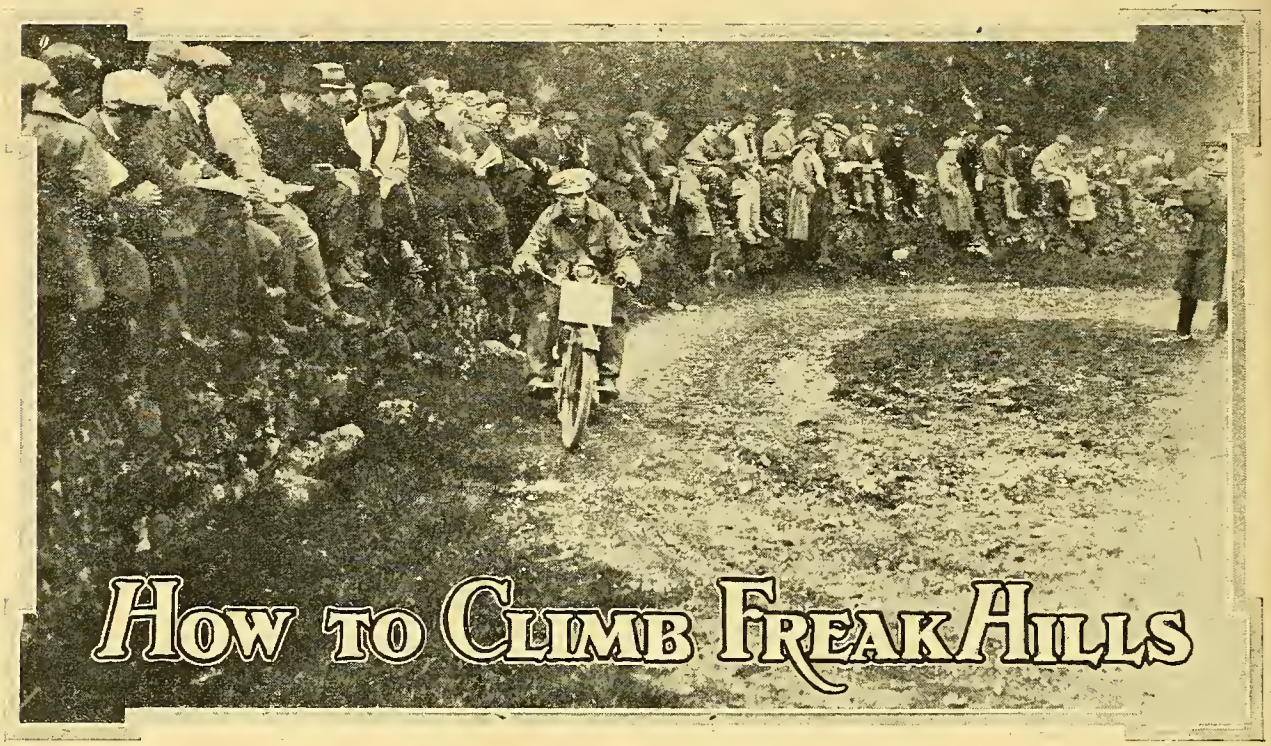
IN these days a first-class motor cycle is capable of almost indefinite use. Of two equally roadworthy machines of different makes, the machine which is the cheaper to buy will be the first to achieve a vogue. In course of time the machine which is *cheaper to maintain* will establish itself as the best seller; and such spare part prices as I instanced in the last paragraph will ultimately destroy the popularity of any mount. There are, as yet, few machines on the road which have been definitely designed with the deliberate aim of securing cheap maintenance over a long term of years. Perhaps the frame of the Scott Sociable is the best illustration of my point. A friend of mine rammed a taxi with his Sociable not long ago, and practically destroyed its snout. With an ordinary tubular frame the resultant repair job would have been a factory job, occupying many hours and costing many pounds. With the Scott patented construction, consisting of short, interchangeable tubes bolted together, the machine was on the road again within a few hours, and the bill was trifling. This idea is capable of application to many small parts of the motor bicycle, *e.g.*, the rear sprocket and the chain case.

## Buying for Keeps.

IT is, moreover, essential alike to the prosperity of factories and to the pockets of riders that this idea shall be put in the very forefront of design. Motor cycles are going to pursue the path which the pedal cycle has already travelled. As recently as 1900 most keen cyclists were buying at least one new pedal cycle every year, as design made forward strides. To-day the average cyclist buys a cycle as he buys a fountain pen—for keeps; he knows it is capable of infinite wear, and that design has become crystallised. We are possibly approaching a similar period in the design of motor cycles, and each summer sees more motor cyclists selecting a mount with the intention of running it to destruction—a process which, with reasonable luck, already represents twenty years. At the moment neither traders nor users have tumbled to the importance of replacements which are cheap to buy, and can be fitted by unskilled hands. At the moment saving in first cost appeals to us all most emphatically. A few experiences, such as those I detail above, will open the eyes of buyers. Economy in maintenance will then emerge into its proper eminence. I can see the day when a visitor to Olympia will brush aside the salesman's impassioned panegyrics with the brief request, "show me your spare parts list, please."

THE CALL OF THE ROAD IN WINTER.

Few motor cyclists nowadays store their machines during the short days of December and January. Half the pleasure of owning a machine is lost if one hesitates to get abroad on the brilliant days with which we are often favoured during those months.



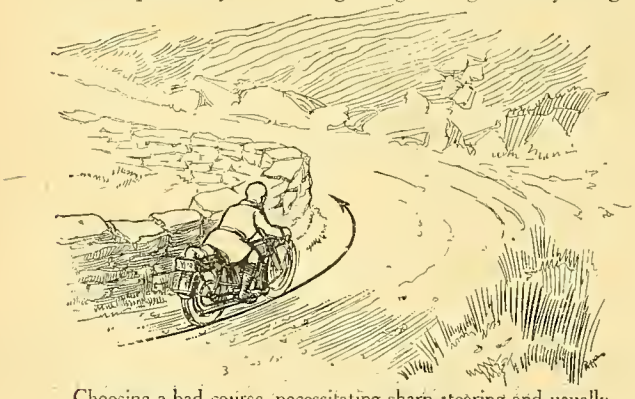
# How to Climb Freak Hills

## Some Deductions and Instructions based on Observation of Various Methods.

By ROAD RIDER.

THE exhibitions which a pressman witnesses at every trial show that many amateurs (and some trade riders) with ambition to shine in competition work have not acquired any grasp on the proper methods of climbing a freak hill. These notes are written for the sake of such comparative novices, and may perhaps provoke a little criticism from experts, whose systems occasionally vary.

The first essential is a good riding position, which involves adjustment of handle-bar, saddle and foot-rests. A very tall man cannot obtain perfect position on a very cobby frame. Most of the cracks are medium-sized men, and several are positive bantams. It is impossible to lay down the law about riding position. Speaking for myself, I try various positions of saddle and bar until I feel comfortable; and comfort probably involves getting enough of my weight on the front wheel to pin it down to a desired track, without, on the other hand, making my wrists carry so much of me that the bucking of the front wheel jolts me about. It is equally important to get the footrests right; if they are so near the saddle or so high up that the legs hang slackly, the body cannot be braced into a system of girders to hold the machine straight on rough going. The legs cannot be straight; but they should be at an angle which makes it possible to get their muscles tense, when required.



Choosing a bad course, necessitating sharp steering and usually the taking of the worst gradient.

How a good rider endeavours to take a hill if the surface does not actually drive him to the centre of the road.

Some amateurs compete on freak hills with standard solo ratios. This is a blunder which trade riders seldom commit. As will be emphasised below, a low road speed is often only the passport to a clean ascent. In these days of chain drive a change of sprocket will easily effect the desired change. 15 to 1 is low

**How to Climb Freak Hills.—**

enough for a good rider, but some men use bottom gears of much lower ratio.

A big jet is always desirable. On some freak hairpins a perfect climb may involve bringing the machine to an almost complete stop at the point of the kink in

A left-hand bend may often be negotiated in this way, swinging wide to get a good view and avoiding the worst gradient, finishing the corner on the proper side of the road.

the road; a 36 jet helps the machine to get away. With a very low gear and a big jet you can generally dodge a baulk; and it is best to do so, as officials are not always genial in the face of a protest.

If the hill is excessively long, or if baulks or picking up from a practical standstill is possible, run out all the hot oil from the crank case at the foot of the hill, and put in four charges of fresh oil. They will often prevent an anvil chorus if the engine has to pick up in a tight place.

Next comes the question of speed. Probably the surest way of keeping a fine course on knobbly going is to rush it at speed. This method requires wrists like steel wire, and considerable audacity. Few men can adopt it successfully, and fewer hills lend themselves to it. In ninety-nine cases out of a hundred it is wiser to go as slowly as possible, *i.e.*, on bottom gear with the throttle in the slow running position. The merit of this cautious ascent is threefold, viz.:

(1.) It obviates wheel slip.

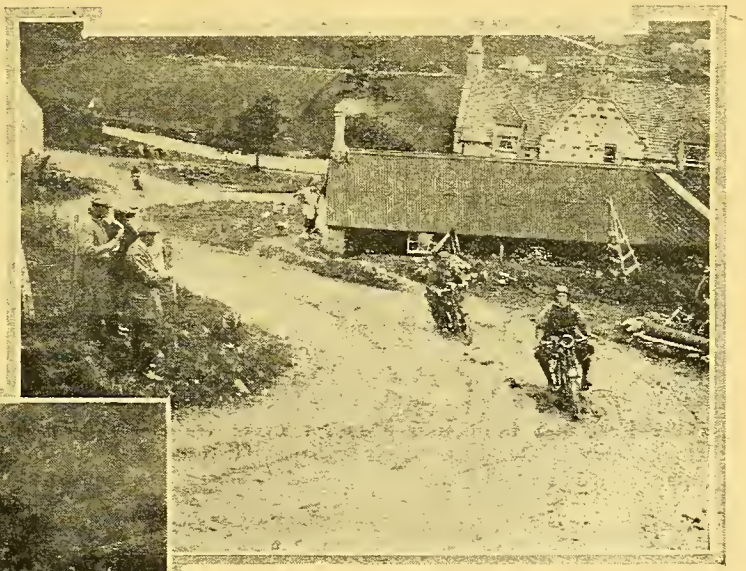
(2.) It gives you the maximum time to pick a path; and on freak hills a clean ascent is often impossible unless the right path is picked.

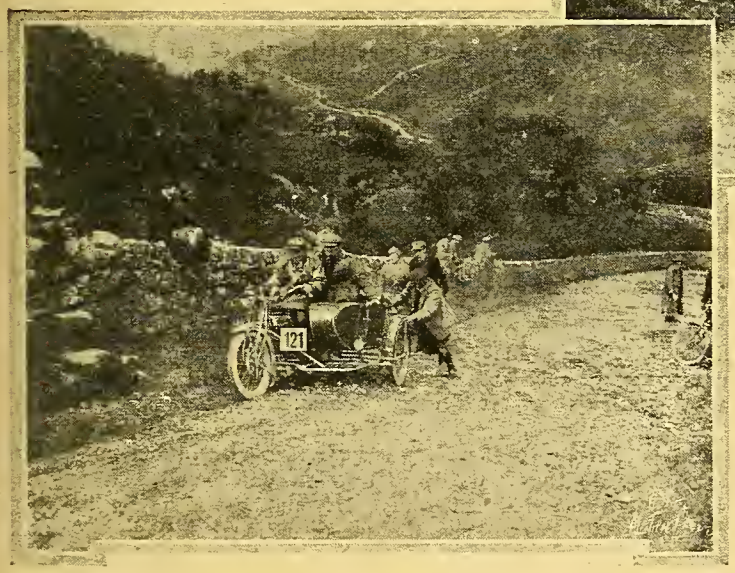
(3.) If it allows small obstacles to deflect your front wheel, it also reduces the violence of such deflections as must inevitably occur.

In every trial many hill failures occur because the men *will* come up much too fast. A 15 to 1 gear with the throttle in slow running position will climb almost any freak hill if the rider be a good man.

### "Footing" to be Avoided.

The feet should next be considered. It is a common fallacy that footing helps. The man who habitually foots will never ride. Steering on a rough surface is a matter of balance, and waving your legs wildly spoils balance rather than improves it. It is arguable whether on a vile surface one sharp dig with a foot may not sometimes prevent an upset; but to keep the feet out all the way up shows that the rider is a funk or has never learnt to balance. *Make it a matter of pride to keep your feet on the rests and you will find that you ride much better.* You know how the steering is spoilt on a good road if you "touch a footrest" or accidentally touch the road with your foot. How much more does a series of clumsy digs with the feet upset the steering on the rough? Find a bit of bad going near home—even if it is dead flat—and take it at various speeds till you can make sure of crossing it with your feet on the rests.





(Left) Where wheel spin, due to the loose surface of the road, has frustrated the driver's best efforts. A scene on Park Rash.

(Right) These two riders illustrate the dictum laid down by the writer of the article by taking the left outside of the road just before rounding a right-hand bend on Cockbridge Ladder.

Wheel-spin ought to be unknown on a solo machine; it always indicates too much throttle. On a sidecar it can be minimised by bouncing,

**How to Climb Freak Hills.—**

by a tread with heavy cross bars, and by the passenger using his weight (if the rules so allow). It is seldom a real nuisance on a sidecar if the gear and engine speed are low.

Path-picking involves three separate items. The first point concerns the few yards of road immediately ahead—you must not get into a rut, or strike a really big stone or reef, or go unnecessarily into deep sand or mud. Secondly, when the next few yards have been passed as all clear, glance swiftly ahead, and plan your general course up as much of the hill as you can see. These two items are not difficult, especially if a little home practice has made you disdainful of the thin layer of small stones which frighten so many duffers. Thirdly—and this is most important—path-picking entails a correct line round corners. The golden rule about hairpins is to take them *dead slow and wide out.* "Dead slow," because you cannot steer sharply without skidding. "Wide out" for three reasons—in the first place the grade is always stiffest on the elbow of a hairpin; secondly, because in 99 cases out of 100 the best going and the hardest track is on the outside; and, thirdly, because a curve of wide radius is easier to steer round than a curve of narrow radius. There are a very few famous hairpins which are best "cut" on the inside; but they are only the exceptions which prove the rule.

# REJUVENATING AN ANCIENT ENGINE.

## A Private Owner's Modernisation of Some Old Components. Competition Successes with the Resulting Machine.

MUCH interest has been shown in an ancient 2¾ h.p. De Dion-engined motor cycle on which B. F. C. Fellowes won a gold medal in the M.C.C. London-Edinburgh runs both in 1920 and 1921, as well as a silver medal in the 1921 London-Exeter Trial last month. The engine of this machine is slightly older than the rider himself, who has supplied us with the following notes:

"Many could, I fell sure, get results which would greatly surprise them with similar and other such experiments as here described. One often sees very old machines in odd corners, sometimes with the now obsolete coil and accumulator ignition and high and weird frames; these can be bought for a song. If the discovery happens to be a De Dion or Ariel tricycle or quad, a Phœnix or Excelsior tandem, so much the better. One may be assured that there is some grand material and fine workmanship to play with.

"The most noticeable failings about these old engines are, of course, the automatic inlet valve, the (usually) very low compression ratio, the small amount of lift to the exhaust valves, and the very restricted exhaust outlet area.

"The engine in possession of the writer was taken out of an old French tricycle (fitted with a surface carburetter) and built into a motor cycle frame—a rather heavy Chater-Lea, which had previously housed an early Minerva engine.

### Increasing Capacity and Compression.

"The first experiment was to raise the compression and get more power by lengthening the stroke. This was done by driving out the crank pin and filling up the holes in the flywheels, reboring and setting the crank pin half-an-inch further out of the centre. This allowed the piston to travel a further inch on the stroke. The piston now could not pass the top of the crank case, so three-eighths of an inch was cut off the skirt to allow it to clear. The piston also came right to the top of the head (which, by the way, is detachable), giving too high a compression, so a quarter-inch ring was placed in the spigot of the crank case, thereby raising the cylinder by that amount.

"The next thing to claim attention was the exhaust outlet. This was originally only five eighths of an inch diameter, with a dead right-angle bend in the exhaust pipe, which is placed at the back of the engine, so it was bored out to one and one-eighth inch, and a flexible pipe was fitted with an easy flow for the burnt charge. As a further relief, an additional outlet was bored into the combustion chamber at the front and a one-inch pipe fitted.

"Still not getting the desired result, a greater lift to the exhaust valve was decided upon. The cam and timing wheel were, therefore, softened, and a strip of one-eighth-inch steel made to fit the cam contour; this was pegged and brazed and again hardened, when the difference in power was most noticeable.

### The Automatic Inlet Valve.

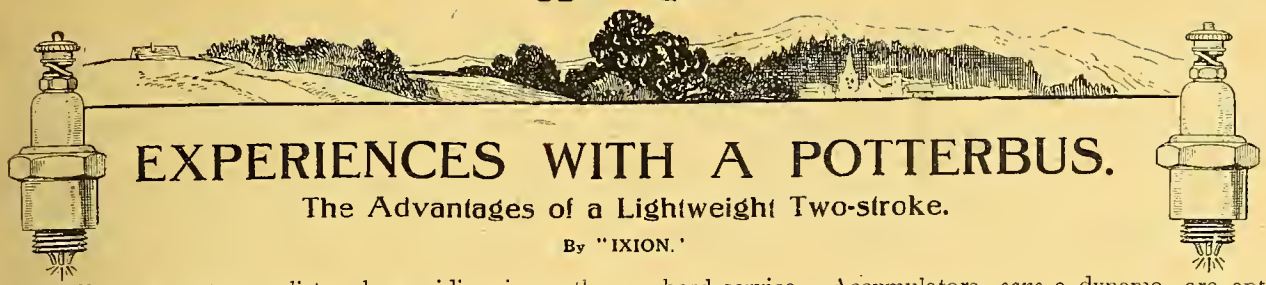
"The old pet subject for argument in days gone by—the automatic inlet valve (which, by the way, is still retained)—is perhaps the most troublesome thing about the machine. However, the best and cheapest method of getting the correct tension spring is to take out the spring from a roller blind. Begin with about ten coils, adding half a coil at a time, and testing until the desired strength of spring is obtained. These are usually of good temper and will stand up to the work for quite a large mileage.

"The lift to the inlet valve will be found to be most efficient at three-sixteenths of an inch.

"With such alterations as the above it is possible to climb hills in company with modern machines. It should be borne in mind that though these experiments may not stand the expert's criticism, they have, nevertheless, proved highly successful, and are the results of many pleasant hours of an amateur's tinkering. The machine described is now fitted with a Phelon and Moore gear, praise of which would be superfluous, and it is a very reliable and trustworthy old barrow."

## THE 1922 PARIS-NICE TRIAL.

This year the Paris-Nice trial will be organised by the Moto-Club de Nice and run between March 1st and 15th. The first stage will be to Dijon *via* Sens and Auxerre; the second through Nantua and Bourg to Lyon; the third through Valence to Avignon, and the final stage *via* Aix and the Esterels to Nice. There will be the usual optional hill-climb (at La Turbie), speed trial, and starting and brake tests.



# EXPERIENCES WITH A POTTERBUS.

## The Advantages of a Lightweight Two-stroke.

By "IXION."

LIKE most motor cyclists whose riding is partly a matter of business, I find that a 2 cwt. or 3 cwt. machine is hardly ideal for short-distance work of a multi-stop character. Laziness probably lies at the root of the utility rider's eternal yearning for two distinct solo machines. But there is a certain logic in many forms of laziness. Using a 7-9 h.p. twin for calling at a dozen factories in Coventry resembles picking one's teeth with a service bayonet. Similarly, anybody who lives in a hilly rural area, and occasionally visits isolated farms in the course of shoots—opening gates, clambering up keepers' paths in copses, and the like—can justify the inertia which makes a powerful machine quite distasteful for such jobs. So during 1921 my touring-cum-competition 'bus has been supplemented by what some contemptuous spirits would term an "auntie model"; to wit, a 190 lb. baby two-stroke. To pile on the horror, this machine has actually possessed a clutch, a kick-starter, legshields, and electric lighting.

### Ease of Handling.

The main merit of such a mount for such work is its extreme lightness. Off-hand, it would not seem to matter much whether a machine scales 190 lb. or 260 lb. In actual practice, unless one is an international rugger forward with a leg-of-mutton forearm compounded of closely stranded fencing wire, that 70 lb. is decisive. I can hold up the baby with one hand whilst I open a gate with the other. I can fling the baby about easily and comfortably when I pause at a factory office. Add 70 lb. to it, and handling becomes a pulley-hauley sort of business for a man of average strength. Rightly or wrongly, I consider that, as soon as 200 lb. is exceeded, we approach a weight which begins to tax people of ordinary physique. They can manage 2½ cwt., yes, even 3 cwt.; but the extra weight converts an easy task into an ordeal.

Easy starting is the next merit of the potterbus. Any sturdy youngster can, of course, start a 500 c.c., or even a 1,000 c.c., without distressing himself; but even when the little engine is slightly below par, no real effort is involved in kicking it into life. When engine-starting is necessary every quarter of a mile, you will love the machine in proportion to the mildness of the effort it involves.

Economy does not really enter into the matter if two machines are kept, for the double depreciation quite wipes out the substantial saving involved in using a small 'bus for local riding.

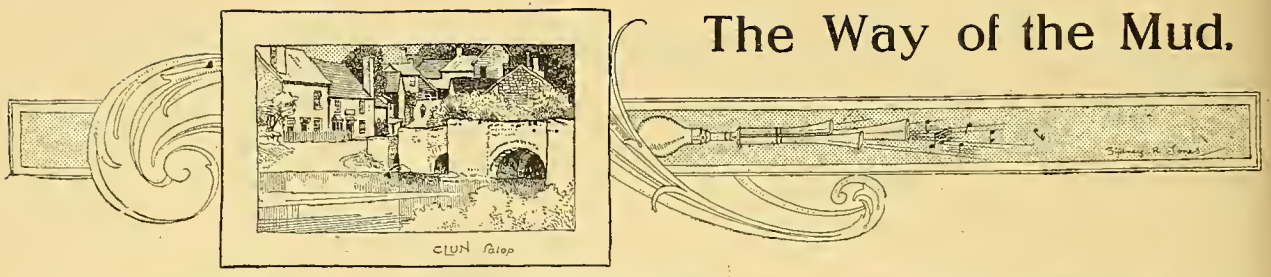
Electric lighting, plus a dynamo of some sort, ought to be regarded as indispensable on a potterbus. The machine is taken out almost every night in the year. Acetylene is seen at its worst in short rides and in daily use. Dry batteries are expensive in hard service. Accumulators, *sans* a dynamo, are apt to be tiresome when they are worked hard. So I regard the dynamo in the same light as the engine—it is indispensable. I have used a B.T.H. Sparklight all the year with absolute satisfaction. It was originally delivered with one of the first experimental battery cases, so designed that the fitting of the cells was a long job, and extremely liable to culminate in two or three short-circuits. The makers supplied me with their later model in due course, and I have never had to open it. But for this equipment, I should have walked, trammed, taxied, or pushbiked many miles.

Full anti-mud equipment is another *sine qua non* on such mounts. I dislike lavish mudguarding on a touring machine. If you add legshields, an under-screen, a big front wheel-splasher, and other protections, you slow the machine; you increase the number of costly accessories liable to damage in the toss which you will inevitably take before the season is over; and who minds "dressing up" for a fast 200 mile run? But oftentimes the potterbus is merely going five miles. The streets are aswim with black soup. Or the wind is keen. Or a light drizzle is falling. Given proper anti-mud equipment, you need only don a British warm; so you motor cycle to your destination, with the minimum of preparation at the start, and the minimum of undressing on arrival.

I have been merrily chaffed all through the summer for using a kick-starter, a clutch, and a prop stand on such a tiny mount. They certainly look ridiculous in the city. But on scores of occasions this year they have been invaluable to a rider who thinks nothing of pushing off a Brooklands single-geared twin on the Portsmouth Road.

### For Longer Distances.

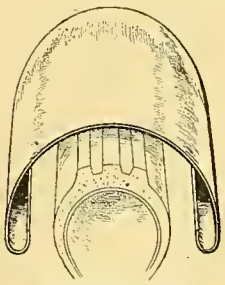
In one respect a subtle change is coming over the potterbuses. I have owned many of them in the past, but I never before owned one which did not prove fatiguing on a long run. They used to be rather dithery. My 1921 model was quite exceptionally comfortable, though its frame was rigid, the saddle small, and so on. Moreover, it could easily do 45 m.p.h. without any excessive fuss. If circumstances pointed that way, I occasionally made quite long runs on it. Indeed, when cold weather or dangerous roads put speed out of the question, I would just as soon take it from London to Coventry as put it to bed and get out a pukka sports machine, with one exception. The exception was that it had a two-speed gear with a very low bottom ratio, so that, when a hill forced me off top, I was reduced to the most humiliating creep. My next potterbus will have a three-speed gear; and I foresee that during the winter months it will not infrequently be converted into a tourist machine for the nonce.



# The Way of the Mud.

## Mudguarding and Weather-prooling Problems approached from a New Angle. The Results of Several Years' Experiment.

TO enlarge upon the fact that in this year of grace we are still far from a solution of the mudguarding problem would simply be to repeat the conclusions drawn in countless articles which have appeared in *The Motor Cycle*. Perhaps the bare fact is worth repeating, however, to give it one more chance of catching the manufacturer's eye.

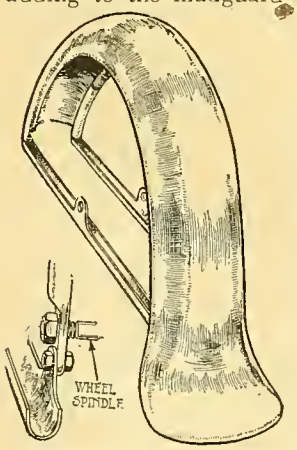


Plain domed and channelled guard

One should call it, rather, the weather-proofing problem, for not until the machine alone but the rider also has been protected as far as possible from mud as well as rain, will thousands of potential motor cyclists enter the ranks. Newcomers to the pastime should be able to count on almost the same standard of comfort as on a car without hood or screen. There is little reason why they should not have it. So, since poor mudguarding is militating against the motor cycle being used by the million, it is a problem of the first magnitude, and therefore worthy of close study.

### Past Efforts.

It has hitherto been "solved" year after year by adding to the mudguard extra width and valances—and weight. To our credit be it said that the arrangements for securing this additional weight and size against rattle show wonderful improvement. But the mud still gets there—to the continued satisfaction of overall and thigh boot manufacturers. The fallacy seems to lie in an idea that mud is thrown directly on to rider and machine. These notes—the result of some years' study and experiment — should show that, except in one inconsiderable case, the mud is simply *thrown into the air and overtaken.*



Channelled stays for use in conjunction with the guard section shown in previous illustration. Inset is the method of stay fixing where wheel spindle is not of the withdrawable variety.

Light liquid such as mud is extremely amenable to the force of wind. One has only to try to fill an oil tank with a minute orifice from a height of several inches in a cross breeze to be convinced of this. It loses its upward or forward velocity very quickly, and begins to fall, slowly at first. When it is remembered that a speed of 15 m.p.h. means covering twenty-two feet in one second—one-third of a cricket pitch—the rider will realise how easy it is to overtake any drops of mud thrown into the air hardly a yard in front of him.

### How the Mud is Thrown.

A wheel running over liquid mud produces two sprays:

1. A tangential spray thrown off the periphery (*e.g.*, tyre tread) by centrifugal force.
2. A lateral spray, sideways from the point of impact at the ground.

The problem is how to prevent, as much as possible, the mud from being thrown into the air, and how to protect the rider and mechanism from the rest.

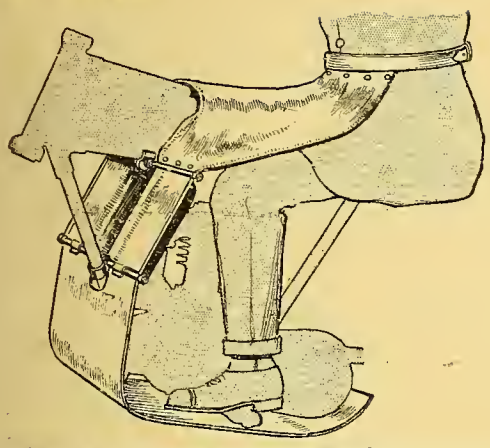
Completely valanced and channelled front mudguard without stays.

Take the front wheel—the mischief-maker. The circular spray is trapped over part of the circumference by even the narrowest T.T. mudguard without valances. But there are two serious loopholes of escape with even the best mudguard existing to-day:

*(a)* The remaining part of the circumference in front of where the present design of mudguard ends. Spray is not thrown high enough to be overtaken by the rider, but reaches the front wheel spokes. It can only be cured by fitting the mudguard front extension still further forward. To prove cause, effect, and remedy, I made a special extension and tried it with a clean front wheel (and legs) over a quiet stretch of muddy road used for most of these experiments. In practice this need not be produced further than nearly level with the hub, I found, and this does not look unsightly. It is this spray, then, which partly dirties the front wheel and forks.

Given a reasonably wide mudguard, the only possible mud that can be said to be thrown towards the engine or rider is the little which escapes between the

**The Way of the Mud.—**



Complete weather-proofing equipment specially recommended for sidecar drivers.

bottom of this mudguard and the ground, easily coped with by means of a small extension (*e.g.*, as on the Triumph), or the undershield to be mentioned later.

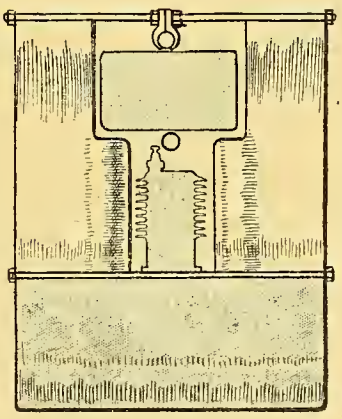
*(b)* The second dribble of mud into the air is off the edge of the usual front guard, with or without valances, anywhere from the forks forward. The mud is thrown on to the guard inside and flows down it to the edge. Long before it can flow along the too gentle slope to each end of the guard, it is either shaken or blown off in big blobs. Even if it does reach the end of the front extension, so much the bigger the blob. These drops leave the edge with practically no speed except forward, and they may land anywhere. I have watched them being held up by a gust and overtaken by my knees. In many cases they will drip or be blown into the spokes, thus completing the ration of mud delivered to the front wheel and forks.

### Preliminary Attempts.

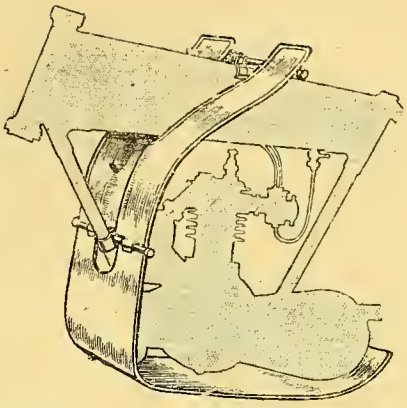
Even if no attempt were made to cure it or the centrifugal spray, there is no reason why either should be allowed to reach the rider and mechanism behind. The obvious remedy for *(b)* is to fit gutters to each side of a wide domed mudguard; the simplest and cheapest method would be to turn in the edge. This suggests a handsome shape which could be beautifully finished and easily kept clean without scratching. But even then, the flow to the front must be led away to reach the ground harmlessly. This is best done by making the mudguard stays of U section. My device for joining these up to the mudguard gutters was crude, and cannot be detailed here. Sufficient that it was successful, and could be improved for ease of manufacture. This led the mud to the extreme bottom of the front mudguard, and on my next run I was delighted to watch cascades of mud pouring from the latter position.

Throughout these notes I am dealing with liquid mud, not half-dry sticky stuff, or the clay which clogs up mudguards. This, not containing enough liquid to "run," does not dirty a reasonably guarded machine, and would not drip into the gutters.

Another idea to incorporate these gutters is a completely valanced guard, as shown in the third sketch, and this is the only excuse for any valances, flaps, wings, or other fancy steel sheeting so usually fitted on or round the front wheel.



Leg-guards turned in to minimise wind resistance and to deflect a stream of air directly on to the cylinder.



Semi-permanent undershield, with quickly detachable leg-guards, for use on light solo machines. The undershield may also be detachable.

### Lateral Spray.

Far from being thrown back at the rider, the lateral spray moves forward at an angle of about 45°, as witness a tramcar on a flooded line. Yet so comparatively low is its velocity that it is easily overtaken in mid-air by any side projections on the machine, which is moving at least ten times as fast. And, as on a non-mudshielded machine the rider's feet are the principal side projections, *this is how the feet get their soaking*. The two alternatives are either to trap the lateral spray *at its source*, or to erect a protective shield *further back* on the overtaking portion of the machine, *i.e.*, just in front of the rider's feet.

From heavier vehicles, such as lorries and 'buses, the lateral spray has proved such a nuisance to other road users, including pedestrians, that every possible effort has been made to trap it. Readers will remember a competition promoted by the L.G.O. Co., which invited the best brains of the world to solve the problem. The Ministry of Transport has also taken up the matter. No appreciable advance has been achieved, however. It was found impossible completely to trap lateral spray. If this is the case with heavy vehicles, where weight and wind resistance are of no account and expense is not a great consideration, how much more so with the motor cycle?

There is no solution, therefore, but the other alternative—the mudshield further back on the machine.

A bottom extension to the front mudguard keeps spray off the crank case; but this is not enough.

There is an outside source of mud which affects all parts of the machine within about a foot of the ground. I shall call it "reactionary splash." Everyone recognises how a drop of mud or rain seems to bounce up again off a wet road. On a rainy day, in addition to the fall of mud from the front wheel, rain drops are also helping to create this reactionary splash, and the centre of the machine catches it at about its highest point. An undershield is necessary to prevent this.

**The Way of the Mud.—**

In addition to an undershield and a main mudshield for the legs, it is time some protection was offered the rider himself against rain and the bitter cold which seems to reach his knees and thighs through even the thickest overalls. The biggest existing mudshield, reaching up to the level of the tank top, does not do this. The remedy seems to be an apron clipped on to the main shield, of patent leather, oilskin, or American cloth, with a strap to go round the rider's waist, and a quick-release buckle behind him. Such an apron is marketed by the College mudshield people for attachment to their excellent shields. It should be supplied by each *maker* either as standard or as a special accessory similar to the special lamp sets often recommended and supplied as extras.

### What is Needed.

The mechanism and rider should therefore be protected by the following fittings in their immediate vicinity:

(1.) An undershield either firmly attached by nuts and bolts if it incorporates the footboards, or made quickly detachable by strong spring clips if footrests are used. It should be a whole length affair, stretching from level with the bottom of the cylinder fins in front to behind the countershaft gear box. This is the absolute minimum of protection, even for sporting machines, on which it could always be made quickly detachable.

(2.) Either *(a)* a sloping clip-on addition. This would minimise wind resistance (the main objection to perpendicular mudshields), and could be made to clear all the tank top fittings. The material could be aluminium to save weight; or *(b)* an almost perpendicular shield attached by clips to the undershield stay and to the tube under the tank by the usual cross member, to which in turn the light apron mentioned above could be attached by a row of push-buttons.

This apron is specially suitable for tanks on which the fittings (oil pump, filler caps, and gear lever) are fairly well forward, as on the Douglas. It would be cut out to clear these. One of the greatest points about this type of apron is that it would afford such excellent protection to the whole machine when left standing in rain.

### The Last Detail.

The final protection suggested for the rider is a couple of side plates fitted at the extreme edge and just in front of the usual position of his feet, and reaching about six inches above their level. In manufacture these could be stamped out in one with the undershield and turned up at right angles afterwards.

With the long wide-skirted trench coat, which I have found to be the only special clothing needed with this system of mudguarding, they would serve both to protect his feet and ankles from the lateral spray thrown by passing vehicles and "distance" props outside which his skirt is arranged to fall, so that, even the flow of rain water down the skirt sides is led clear of his feet. Alternatively, a wide valance could be incorporated in the main shield, but the objection to this is that it prevents the leg being shot out sideways in an emergency, such as a skid on a solo machine. On a sidecar machine the valance would have no disadvantage except perhaps its appearance.

It should be added that each of these suggestions has been personally carried out and tested. What is advocated is a "weather shield," such as would cope as far as possible with *all* the conditions which at present make it necessary to wear special clothing, *i.e.*, cold and rain, as well as merely mud. The system of front shield and apron has several minor disadvantages, the most serious of which is wind resistance; the least, appearance. The disadvantages would disappear once the manufacturer tackled the job and made a shield as part of the machine. Lightweights could have the undershield only as permanent, the other parts for attachment in winter. All sidecar outfits should have the full system.

### Wind Resistance.

With regard to wind resistance, the bugbear of all mudshielding, I have found that this is more than neutralised if the edges of the shield are turned in along the height of the cylinder to deflect wind into it. That is to say, the cylinder gets more wind by this deflection under any condition except a following gale—when it gets no air in any case.

### The Back Wheel.

Considered in the cold light of logic, the back wheel is really very harmless to the rider. Provided tyre and chain or belt are reasonably guarded, no mud can reach the rider from this source. To save the wheel itself, however, from its own mud—if it is to be kept clean—the mudguard should have the same type of gutters as suggested for the front guard. To protect it as far as possible from the torrent of reactionary splash due to droppings from the front wheel and the rest of the machine, it should be carried to within six inches of the ground in front, ending in a wide extension much like the Triumph front shield reversed.

E. M. WRIGHT.

## ENGINES AND THEIR POSITION IN THE FRAME.

CONSIDERING the large number of manufacturers interested in the motor cycle movement, it is, at first sight, somewhat surprising that engine design has settled down into four main types: (1) four-stroke single, (2) two-stroke single, (3) four-stroke flat twin, and (4) the V type four-stroke twin.

There are, of course, isolated additions to this list. The four-cylinder is represented by America and Belgium, but is not produced by a British firm. There is also the V twin two-stroke Stanger, and the three-cylinder radial, but, in the long list of engine types suitable for motor cycles, there are several blanks.

For example, one is constrained to wonder why the four-stroke side-by-side twin, so popular in France, is not favoured by British manufacturers.

Then there is the "flat four" (*i.e.*, two flat twins side by side), the three-cylinder-in-line engine, the side-by-side twin two-stroke, represented only by the Scott, and the flat twin two-stroke, of which the Economic is the sole example. Then, the majority of designers seem to consider the upright position ideal, yet the P. and M., Powell, Dunelt, and Sun are successful machines with engines in an inclined position.

VEDETTE.

# The Single Track Carette

## Many Designers have Given this Type of Machine their Special Favour

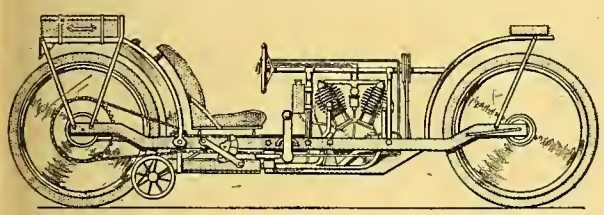
### Some Suggestions Reviewed.

The single track two-seater designed by Mr. C. F. Beauvais, and referred to in the latter part of the article.

DESPITE the fact that very few heavy-weight motor cycles are used as solo mounts, owing to their unwieldy size and weight, the single-track car never fails to interest designers.

Since the early days of the motor cycle movement attempts have been made to evolve a motor bicycle on car lines, but very few have reached the production stage until this year, when, at the Berlin Show, a motor cycle with an enclosed body was exhibited, and created a certain amount of attention.

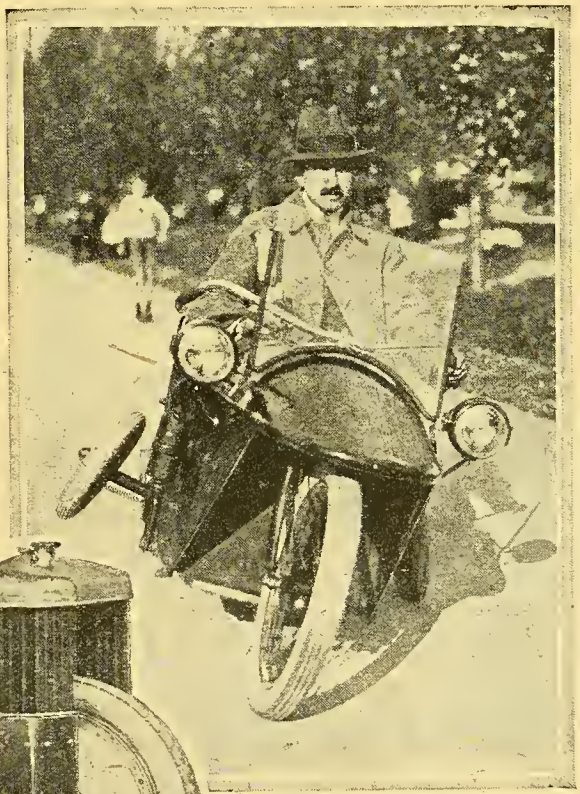
In the car world, however, the idea has been carried further, and, so far back as 1913, a monster single-track car was illustrated in these pages. Known as the Biautogo, it had an eight-cylinder V engine with cylinders of 82 × 127 mm. bore and stroke (5,368 c.c.), and at speeds above 20 m.p.h. it was balanced like a bicycle; at lower speeds small side wheels were brought into contact with the road. In 1914 a Russian designer went a little further, and induced the Wolseley Co. to make him a seven-seated single-track car equipped with gyroscopes to maintain equilibrium.



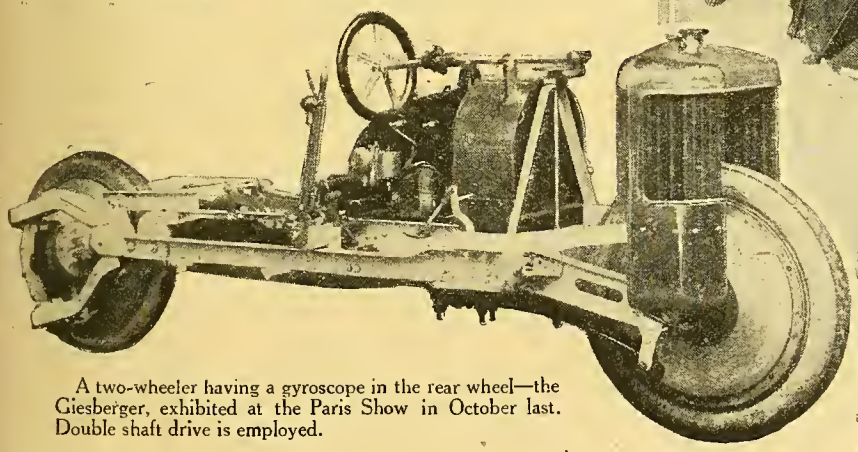
A design embodying a pressed steel frame, V twin engine, and wheel steering, by a reader, Mr. F. C. Dee.

At the last Paris Salon a gyroscope-balanced light car was exhibited as a commercial proposition. It was driven by shafts on each side of the rear wheel, which contained the gyroscopes.

From time to time we have illustrated in these pages the many attempts to design or produce a single-track



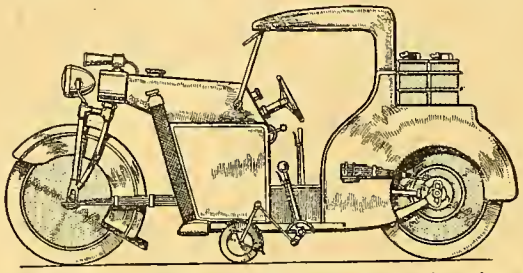
A single track runabout of German origin—the Mauser. When standing or running, the side axle may be hinged downwards, allowing the wheels to come in contact with the road. When running at speed the axle is raised.



A two-wheeler having a gyroscope in the rear wheel—the Giesberger, exhibited at the Paris Show in October last. Double shaft drive is employed.

**The Single Track Carette.—**

carette, and quite recently we published details of a Douglas motor cycle converted by Messrs. Brown and Roper, of Salisbury. Like the majority of such designs, steadying wheels were incorporated. Now Harold Todd, a thirteen-year-old reader of Preston, Lancs., sends us a suggested design which reveals a promising designer in embryo. Details are lacking, but from the drawing it is clear that a water-cooled

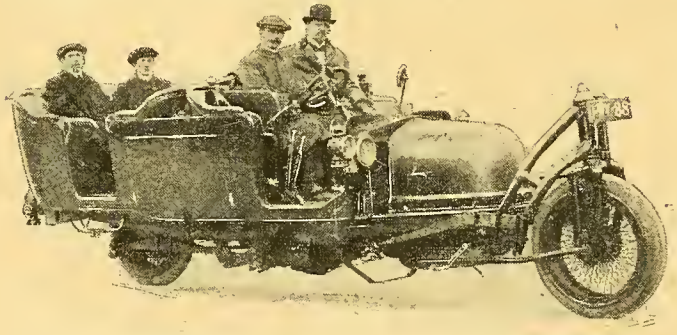


Inspired by various remarks on weather protection of motor cycles, Master Harold Todd, of Preston, a schoolboy of thirteen years, evolved the above commendable little carette, the weaknesses of which he will no doubt appreciate in a few years' time, as his knowledge of mechanics increases.

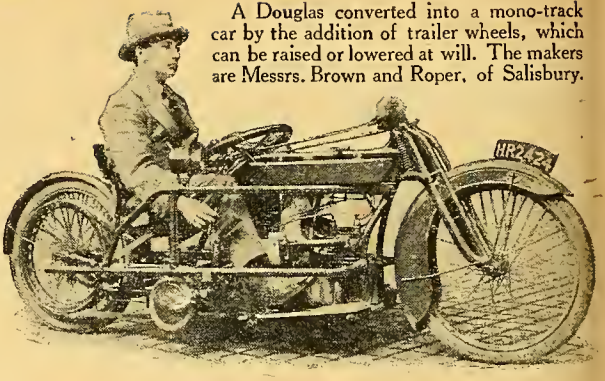
engine and shaft drive are intended. Another reader, Mr. F. C. Dee, also submits a design which suggests the Ner-a-car as the source of inspiration; but the most interesting of all is the design by Mr. C. F. Beauvais, of 9, Bavent Road, Camberwell, S.E.5.

The idea occurred to him through driving a sidecar outfit at an angle with the sidecar wheel off the ground.

The Beauvais single-track two-seater is the outcome of Mr. Beauvais's experiments with a sidecar, and he has given careful consideration to weight distribution, general construction, and proper balance. Such



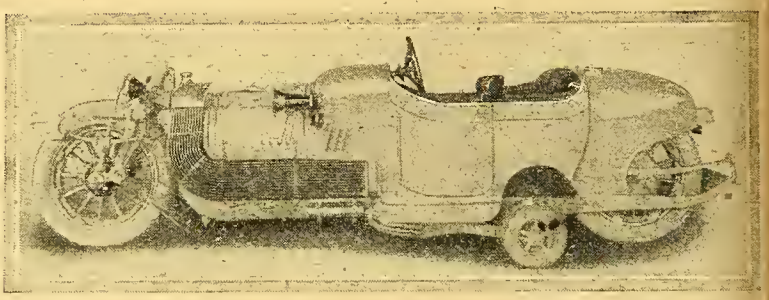
A gigantic gyroscopic mono-track car capable of seating seven passengers. This vehicle was made by the Wolseley Motors, Ltd., many years ago to the order of a Russian enthusiast.



A Douglas converted into a mono-track car by the addition of trailer wheels, which can be raised or lowered at will. The makers are Messrs. Brown and Roper, of Salisbury.

a vehicle, he claims, will enable fast travel with low cost, full protection and comfort, and, in a word, "a car on two wheels" at the cost of a heavyweight motor cycle.

The heaviest parts, namely the frame and engine, are placed practically below the axle line, and the engine is situated as close to the front wheel as it is possible to get it. The passenger's and driver's weight are in line with the axle, and no part overhangs the



The Biautogo, a 1913 single-track car of American design, embodying an eight-cylinder 35 h.p. engine.

rear wheel. The motive power suggested is an air-cooled flat twin driving by means of a shaft, and a gear box incorporating three speeds and clutch, driving thence by chain to the rear wheel. This arrangement allows of a central change speed lever.

Mr. Beauvais has also considered the fitting of a pair of small wheels held by springs and made to be hinged on to a cross tube, which latter is rotated by a hand lever so that the wheels can be lowered or raised at will. These would serve to keep the car upright when stationary or when crawling in traffic, and might be employed to counteract side-slip. It is estimated that the weight of the machine complete would be approximately 5 cwt.

## ENGINE STARTING IN WINTRY WEATHER.

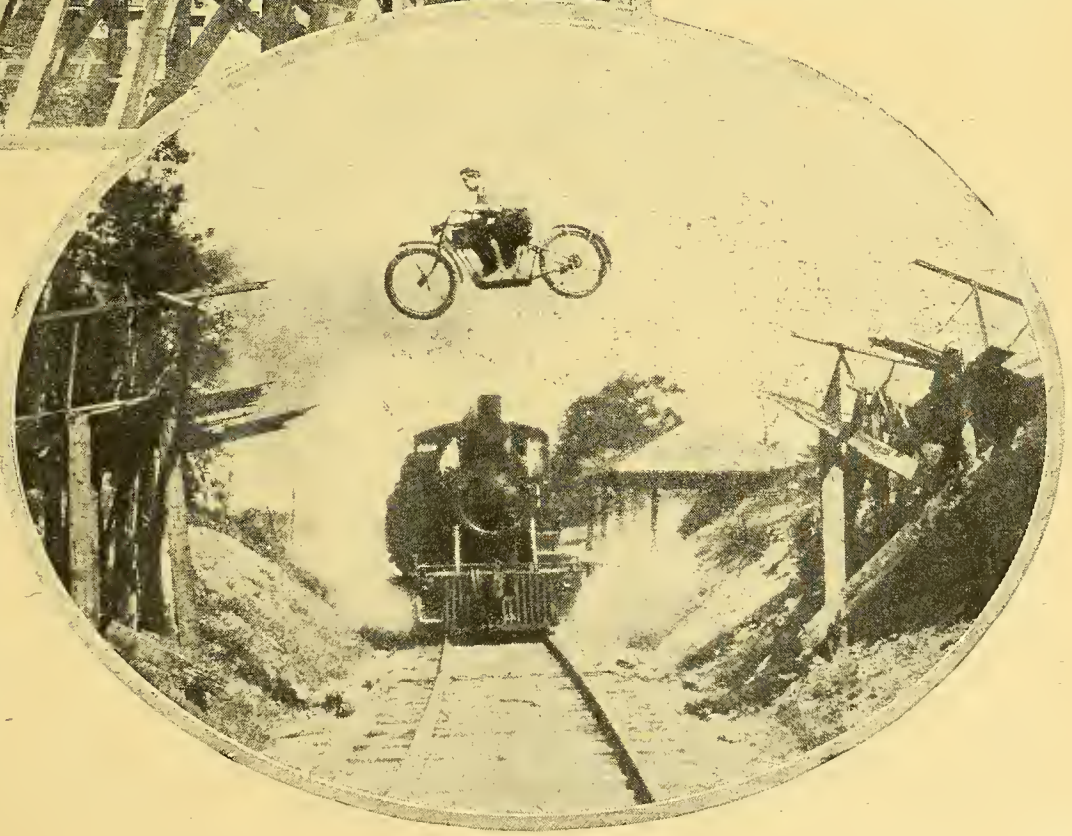
WINTER brings with it the difficulties of persuading a cold engine to start. There are few things so aggravating, especially to those who use their motor cycle for travelling to and from their work each day. Every minute is precious, when wanting to get off in a hurry. Much time is wasted in investigating likely sources of disorder. Yet in nine cases out of ten, the only trouble really existing is a gummy engine, or too weak a mixture. To overcome this trouble, the rider should make sure first of all that he is not using too thick an oil. Injecting a very small quantity of paraffin into the cylinder overnight, or a few minutes before starting, will be of great assistance in such cases. All extra air should be shut off and a rough and-ready way of closing the air passage holes in car buretter should be found. A piece of thick rag tightly tied is quite sufficient. M.G.E.

# THE MOTOR CYCLE AND THE CINEMA.

## Daring Exploits of a Motor Cyclist Film Star.

IT is not surprising that film producers have found good use for the motor cycle. In the serial films which nightly draw regular crowds there is ample scope to introduce the speedy two-wheeler, provided a suitable rider can be found to play the hero. A serial called "Hurricane Hutch," which is being handled in this country by Pathé Frères, is full of exciting episodes introducing a motor cycle. Charles Hutchison, who plays the lead, has some remarkable adventures, as will be realised from the accompanying illustrations. The film is not yet released, but we understand that the story concerns a race against time—and also against the train, which is likewise in a hurry. His leap across a gap left by a broken bridge, we are assured by Messrs. Pathé, is absolutely genuine, there being no "faking" whatsoever.

Charles Hutchison recently stated to a cinema journal that, in making a leap of this character, it is essential that a very high speed be attained, and a certain elevation reached from which to leap away; once out into space, it is necessary to switch off the engine, otherwise the machine would become unmanageable on landing. We are told that the machine upon which this leap was made is still good to repeat it.



A MOTOR CYCLIST CINEMA STAR.

Charles Hutchison, who plays the lead in a sensational film serial, entitled "Hurricane Hutch"; he introduces many thrilling episodes in which his motor cycle plays an important part. Pathé Frères, who handle the film in this country, affirm that the scenes depicted are not faked, but are genuine achievements in every way.

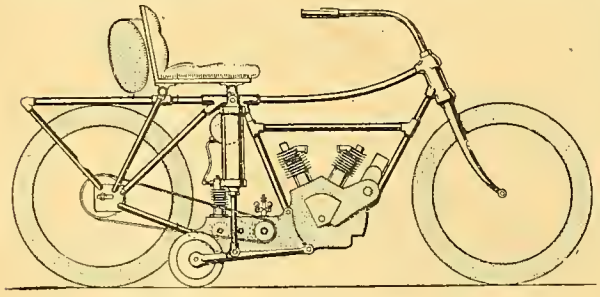
## Automatic Trailing Wheels.

IF the two-wheeled car type of motor bicycle, always a favourite topic, ever comes along, a device on the lines of Mr. Purdy's invention will be essential to it. Many inventors have proposed to equip motor bicycles with a trailing pair of steadying wheels, designed to support the machine at low speeds or when it is stationary. Mr. Hayes actually marketed such a device with some success for several years. But, to the best of my memory, all previous devices of the kind have been hand-controlled, whereas Mr. Purdy's equipment functions automatically. The wheel carriers are hinged at the base of the crank case, and the control rods are coupled to pistons working in small cylinders on both sides of the saddle-pillar. As shown, the trailing wheels are just in advance of the rear wheel.

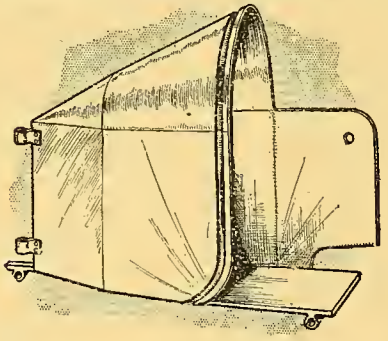
A small air pump may be clutched to the engine by a hand lever as long and as often as is needed to charge a storage tank with compressed air. A centrifugal governor, varying in speed with the engine, operates a slide valve, which admits compressed air from the storage tank to the upper or underside of the pistons which control the rise and fall of the trailing wheels. At high engine speeds the governor passes air to the underside of the pistons, and lifts the wheels; at low engine speeds, or when the engine is stopped, the governor passes air to the upper side of the pistons, and forces the wheels downwards. An automatic and pneumatic control of the trailing wheels is thus provided. The apparatus will plainly weigh quite a lot, and be fairly expensive to manufacture; but neither of these objections is very important where a two-wheeled car is concerned. At any rate, the notion is to be welcomed as what the horticulturists would call a "new break."



Purdy's safety supports. No. 144,846 7/5/19

## Leg Shields.

Twin scuttle dashes, one for each leg, represent Mr. G. R. Slater's ideal of motor cycle comfort in bad weather. Between the scuttle dashes there is a neat tunnel down which air can flow on to the cylinder. The fittings will undoubtedly keep the rider's legs warm and dry. My one criticism would be that perhaps nobody but George Dance would have the pluck to ride with his legs enclosed in these traps. Imagine yourself, gentle reader, skidding with great suddenness and violence. Could you kick

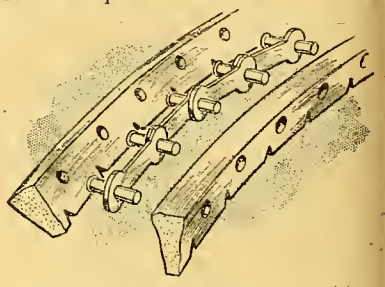


Slater's leg screen. No. 161,689 14/4/21.

your legs clear? I trow not. On the other hand, if you were to chop off the rear 9in. or so of each scuttle, the protection would hardly exceed that provided by the common or garden type of leg-shield. Which probably explains why existing patterns do not come so far back.

## The Belt Problem Re-attacked.

Ulysses did not know more about men and places than I know about belts. As a greyheaded survivor from the earliest days of the motor era, my sufferings with belts constitute an Odyssey. I would not for the world dash the spirits of Mr. F. H. Baker, who still dreams, as others have done before him, of an unbreakable and unstretchable belt. The sketch makes his ideas clear. The chain embedded within a built-up belt is to take all the end pull, and the leather, or rubbered canvas, sides are to bear no burden beyond that of frictional contact with the pulley groove. If Mr. Baker studies the Forward and Whittle belts, he will admit the possibility that their designers, too, have conceived notions like his own. That they do not market them is due to the fact that just as oil and water do not mix, so leather and steel never quite hit it off in too intimate

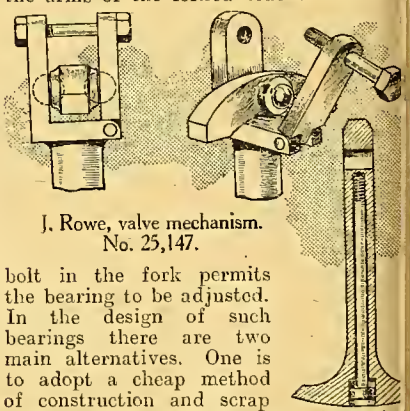


Baker's rubber and canvas belt. No. 161,908. 21/4/21.

a companionship. I would speculate that his belt *will* stretch despite his fondest hopes; that, when it stretches, the holes in it fall out of register with the steel pins which they are supposed to accommodate; and that things will shortly begin to happen.

## Simple o.h.v. Rocker Bearings.

Mr. J. Rowe propounds a cheap rocker bearing for o.h.v., which reminds me of the Finch "non-stick" bearing for a magneto contact breaker rocker. Two balls are interposed between hemispherical recesses in the sides of the rocker and in the arms of the forked bracket. A cross



J. Rowe, valve mechanism. No. 25,147.

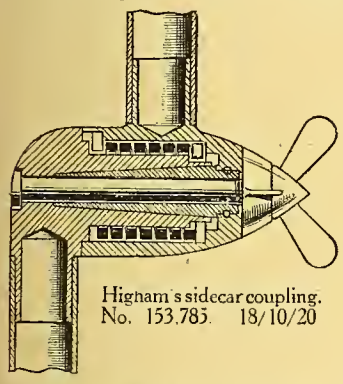
bolt in the fork permits the bearing to be adjusted. In the design of such bearings there are two main alternatives. One is to adopt a cheap method of construction and scrap the parts when they wear; the other is to fit very expensive bearings in the hope of long life. Mr. Rowe's gadget is very cheap, and should be fairly

**Recent Patents.—**

durable. He further protects a safety type of o.h.v., reminiscent in principle of the Buckingham safety valve, though different in form. A guardian screw is inserted in the valve to prevent the valve head from dropping into the cylinder if the neck snaps. I may be wrong, but I should fancy that it would be cheaper to use an unbreakable steel than to adopt Mr. Rowe's mode of construction with a cheaper metal. Steels are now available which will stand all ordinary stresses.

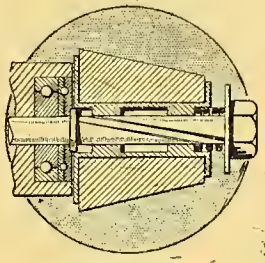
### Flexible Sidecar Connections.

Lieut. W. H. M. Higham has been struck—like most observers—with the number of fractured sidecar frames which disfigure every big trial. The average designer attempts to solve the implied problem by increasing the gauge of his tubing, piling on struts, etc., till some sidecar chassis begin to remind us of the "kolossal" petrol tractors utilised by the Hun to haul his siege artillery. Lieut. Higham follows a more attractive line in aiming at flexible connections. He does not go so far as one famous



Higham's sidecar coupling. No. 153,785. 18/10/20

inventor of sidecars, who evolved connections so elastic that the outfit could not stand up by itself, and sometimes nipped the driver's leg severely when the bicycle leant "in" and the sidecar leant "out" on a corner. The sketch depicts the Higham connection, which consists of inner and outed cones with a sharp taper, and a spring to take up clearance. The inventor claims that the construction allows a limited vibratory movement of the sidecar chassis in relation to the cycle, and further permits of relative rotation between the two aforementioned cones. I am not quite sure that the limited vibratory movement is of value. It reminds me of an imaginary car fitted with J.M. shock absorbers, but devoid of chassis springs; in other words, is it not the *big* jars which smash up the sidecars? The other aspect of the device would do something to relieve the connections of twisting strains, provided the "clutches" do not jam up solidly.



Mepstead's shaft transmission. No. 161,305. 13/4/21.

### Wheel Disc for Friction Drive.

Wheel discs are familiar. So is the "flowerpot" type of friction drive. Mr. G. S. Mepstead has hit upon the notion of combining these two items into a new transmission. He uses a universally jointed shaft between the engine and the flowerpot. The flowerpot makes frictional contact with a rear wheel disc of similar angle. A variety of ratios are obtained by sliding the flowerpot fore and aft in a special carrier affixed to the chain stays. The drive would not, of course, be particularly light. Rather heavy springs might be needed to secure plenty of pressure between the flowerpot and the disc. But the chief snag which I foresee has reference to the filthy condition of the wheel disc over softish roads in really bad weather. The flowerpot would be thoroughly dowsed in gritty mire; and one wonders how often its compo facing would need renewal.

### Protecting the Complexion

In olden days the fan added charm to young women, as the lorgnette added terror to the patronising hauteur of their elders. Mr. Cedric Chivers was presumably remembering these aids to personal magnetism when he patented his motorists' hand windscreen. As it is probably impossible to-day to buy a car which is not fitted with a full-sized windscreen, Mr. Chivers must have had motor cyclists specially in mind. There may be a sale for such a gadget. I can imagine that a lady of extreme beauty but aloof temperament might find the screen useful in repelling the optical advances of ardent males. But, for sheer unalloyed comfort, I fancy an Easting would still hold the field on the average sidecar.

Chivers's hand windscreen. No.161,705. 19/4/21

# MOISTENING THE MIXTURE.

## The Link Humidifier for Admitting Moistened Extra Air to the Engine.

IT is generally admitted that motor vehicles run better under conditions which usually prevail at night. This, it is thought, is due to the fact that in the evening and early morning there is more moisture in the atmosphere, which enriches the hydrocarbons with hydrogen, and at the same time releases oxygen, which, in conjunction with the hydrogen in the air, tends to aid combustion.

Before the war we made several interesting experiments to introduce water into the combustion head, and, although the nature of the device prevented any certainty of result, there were times when remarkably smooth running was obtained.

Now Mr. Link has come along with a device to humidify the mixture artificially, and this he has succeeded in doing in an ingenious manner. There is a small water tank containing what may be described as a wick carburetter, so arranged that the gas drawn into the cylinder is thoroughly impregnated with moisture. The air is taken in through an extra air inlet situated on the top of the device, which consists of an automatic air valve which may be regulated at will.

The humidifier (which is sold by Link Humidifiers, 10-18, Miller's Avenue, Hackney, E.8) has been on the market for some time for cars and lorries, and a new model has been introduced for motor cycles. We have one of these under test at the present time, and at a later date we shall deal further with the matter.

### Next Week.

The next issue of *The Motor Cycle* will contain a review of the motor cycle exhibits at the Scottish Show.

### Motor Taxation in Italy.

No taxes are levied in Italy on small auxiliary motors not exceeding 3 h.p. which are fixed to bicycles.

### Preparedness.

Never go out for a run without a good coat and leggings. Winter weather is apt to be treacherous, and a drenching is uncomfortable, and may lead to a chill.

### A Warning.

Look to your tyres and lighting sets. A puncture during the long summer days is of little account, but a delay in winter weather is unpleasant, and may entail lighting up before reaching your destination.

### Under Difficulties.

T. G. Meeten's mount in the London-Gloucester trial was a 1912 Rudge Multi, deficient, as the result of a skid, of one handle-bar! He made a non-stop run, on time, until he lost his route card near the finish.

### The Next Big Trial.

Saturday, February 25th, has been decided upon as the date for the Colmore Cup trial by its organisers, the Sutton Coldfield and North Birmingham A.C. This old-established and popular event will be considerably stiffened up this year, without, however, including any freak watersplashes, etc.

### Plated Parts.

If you have not already done so, cover all plated parts with some transparent varnish or lacquer. Vaseline is a good substitute, but whatever you employ remember that the parts to be treated must be clean, bright, and dry before application

### Ex-Service Men in Motor Industry.

Over 3,500 ex-Service men have advised the committee for the employment of discharged soldiers connected with the motor and aircraft industries that they have obtained situations through their agency.

### Reunion of Scottish D.R.'s.

The Scottish ex-despatch riders' reunion and dinner will be held at Ferguson and Forrester's Restaurant, Glasgow, on Tuesday, January 31st, at 7 p.m. Last year's event was a great success, and was attended by nearly seventy ex-D.R.'s. The forthcoming function promises to be even better. An enjoyable evening can be depended upon, and an excellent programme of entertainment is being arranged. Tickets, price 10s. 6d. each, may be obtained from the D.R. Engineering Co., Ltd., Dunfermline, or from Mr. R. Watson, jun., 6, Cecil Place, Ibrox, Glasgow.

**MOTOR CYCLES at the SCOTTISH SHOW.**

**NEXT THURSDAY,**

**THE MOTOR CYCLE**

**will contain a guide to the motor cycle exhibits at the Scottish Automobile Show, which opens on the 27th inst. in the Kelvin Hall, Glasgow.**

### A T.T. Rider?

That excellent motor cycle sportsman, Capt. A. G. Miller, the donor of the £200 gold cup for the last year's 500 miles race, is competing in the car Tourist Trophy. Notwithstanding this fact, he is just as anxious to enter for the motor cycle T.T. races, and would like to hear from any manufacturer who is in need of a rider, as he has not yet definitely fixed up with anybody.

### At Kempton Park.

A large space opposite the Kempton Park racecourse has been secured by the R.A.C., and it is being suitably laid out for use as a motor enclosure in connection with future race meetings, and will be available for the National Hunt meeting on January 27th and 28th. The charge for motor cycles will be 1s. per day. R.A.C. guides will attend.

### The Scottish Show.

The Scottish Show, which this year, for the first time, includes exhibits of motor cycle manufacturers, opens on the 27th inst. at Kelvin Hall, Glasgow.

### Proposed Motor Cycle Clubs for Lee and King's Norton.

New clubs are being formed every week. Mr. D. L. Davis, of 110, Northfield Road, King's Norton, Birmingham, would like to get into communication with King's Norton and Northfield motor cyclists, with a view to organising a local club. The same thing applies at Lee, London, S.E.13, in the case of Mr. S. C. Pearce, 256, High Road, Lee, London, S.E.13.

### Touring in Spain.

The Royal Automobile Club learns that the R.A.C. of Spain has established an enquiry bureau at Behobia (on the Franco-Spanish frontier), where tourists may obtain gratuitous information regarding routes, mileages, hotels, garages, etc. Members and associates of the Royal Automobile Club showing their membership cards are assured of courteous attention.

### Ruining the Club Spirit.

Having paid his subscription and joined a certain South Wales motor cycle club, a reader fears that he is "inadvertently financing a secret society of the Klu Klux Klan brand." He reads reports of club activities, and has even witnessed a speed event and discovered that it was organised by his club. We publish this fully authenticated grouse as a reminder to the club concerned and any other club which do not keep their members fully posted of their future activities.

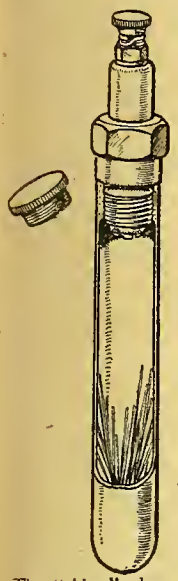
### Legal Sympathy.

Only a practical motor cyclist could have been responsible for the following extract from a review of "Law and the Lawyers," 1921, in a recent issue of the *Law Times*: "It is noticeable that this year has been marked by a somewhat over-zealous series of prosecutions in whist drives, and in the Guildford area the police have betrayed great activity in prosecutions of motor cyclists who had only one, instead of two, independent brakes on their machines. Here we find the law completely against the mature experience of riders who have learnt from bitter experience what a perilous adjunct a front wheel brake is, and manufacturers, realising this incontrovertible fact, have consequently omitted in some cases to add this brake, with serious results to riders. There is room here for a benevolent hint from headquarters."

# SOME NOTES ON SPARKING PLUGS.

## Tests of Discarded Plugs which served to Discover their Faults.

MOST motor cyclists have a few old plugs lying under suspicion in some odd corner of the garage. The owner has probably been troubled with misfiring or "nonstartitis" on some urgent occasion, has inserted a new plug, and put the culprit aside as C3. On a wet afternoon or dark evening a little profit or instruction may be obtained from testing these discarded plugs.

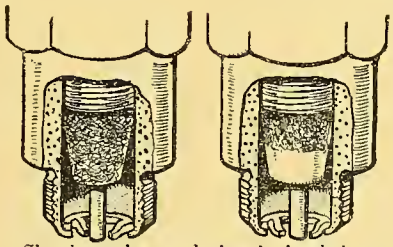


The "Ajax" plug cleaner.

Far and away the simplest method consists of utilising a small four-cylinder engine (your neighbour's light car?) or a flat twin motor cycle engine (your own Douglas?), with or without a "Radamax" spark tester as an auxiliary. A neighbour and myself recently spent a most interesting evening testing some three dozen old plugs with the aid of his Deemster car engine. We commenced operations after dark so that the sparks—if any—might show up to the best advantage. Rain and cold were excluded by almost closing the garage door. We placed the car with its exhaust pipe close against the open portion of the folding doors, to avoid asphyxiation. The Deemster engine was then equipped with three sound plugs, on which it will invariably start at a half turn of the handle or a slight pull of the mechanical lever; and the fourth cable was coupled to the particular "dud" plug under test, this being held in an enormous shifting spanner, securely fixed to the engine and so earthed.

### An Elusive Fault.

After the first few plugs had been tested, the chief defect of the modern plug was thrown into high relief, and some of the difficulties which users experience in "vetting" plugs were elucidated. About 80% of the tested plugs were very nearly perfect, but showed a slight tendency to spark deep inside their cupped heads, instead of across their lawful gap. A film of carbon had formed over the interior insulating surface, and at the narrowest diameter of the cupped portion this carbon—which is a conductor—was very close to the metal body of the plug. In several cases the plug sparked accurately at low engine speeds, and functioned well at higher speeds as a rule; but every now and then it would miss a spark altogether, and every now and then a number of sparks would jump deep up in the cup, instead of across the gap. With such a plug fitted to the engine, instead of exposed, the sparks inside the cup apparently failed to fire the charge, probably owing to dead gas being pocketed there.



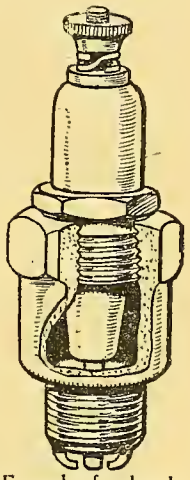
Showing carbon on the interior insulation, and (right) the base of the latter cleaned to prevent leakage of current.

My neighbour now began to curse his Radamax tester, which he considered had failed to identify these faulty plugs, when it was applied to them with the engine running. I pointed out that with the plug exposed and sparking in air, we had only spotted the fault by:

1. Running the engine at various speeds.
2. Extending the test over two or three minutes.

A brief test at low or moderate engine speeds would evince no fault either with the plug exposed or by the Radamax tester.

The next problem which arose was naturally the reconditioning of these plugs. None of them were really dirty. If the insulator was mica, they appeared quite clean to the eye; if the insulator was whitish, *e.g.*, steatite or porcelain, it was tinted pastry colour. We did not possess one of the "needles-in-a-bottle" cleaners, which might have met the case. Some of the plugs were of the "detachable" type, and these were readily rendered fit for service by unscrewing the insulator, gripping it in a vice, and brushing it with petrol. My neighbour watched this process with interest, and vowed he would never purchase another non-dismountable plug.



Example of a detachable plug.

### Cleaning Difficulties.

It was gratifying to notice that the gaskets of the detachable plugs had proved gastight in every instance, no stains of "blowing through" being discernible on the outside of their insulators. The cleansing of the plugs with cemented joints between butt and insulator was necessarily a more awkward process. Their business ends were first cleansed as far as possible with a stiff toothbrush dipped in petrol; after which the small blade of a penknife was used to scrape away the carbon from the cone of the insulator. Obviously, when such a plug sparks inside the cup instead of across the gap, the current is running down the cone from the central electrode; therefore, if a white ring can be created on the insulating surface all round the central electrode, the shorting will cease. On the other hand, it may not take long for a fresh film of carbon to form.

Only one plug appeared to have developed an internal short circuit clean through the insulator to the body. We could not find any crack in the insulator, but even when the plug was spotlessly clean, nothing would wring a visible spark from it.

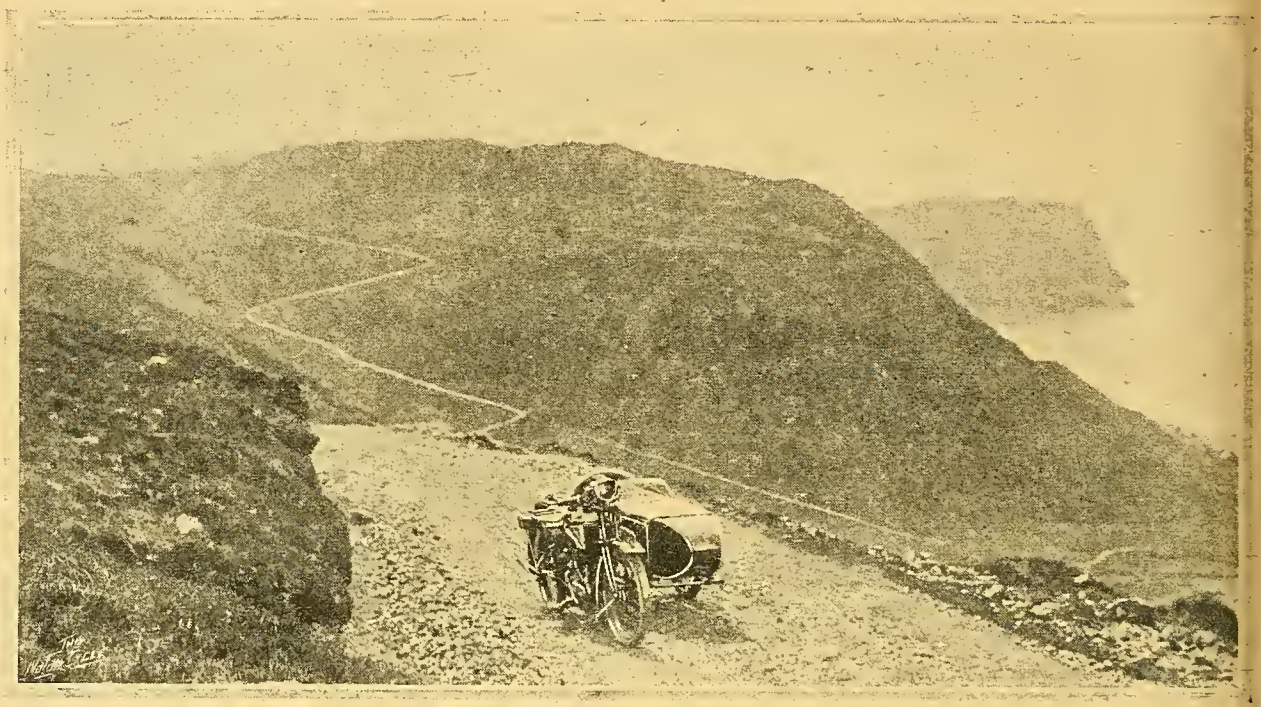
Several of the motor cycle plugs were heavily encrusted with burnt oil, as distinct from the ordinary film, which is so thin that nothing but its dark colour betrays its presence. In these cases the practical difficulties of cleansing naturally arose if the plug was of the non-dismountable type.

On the following evening two or three more enthusiasts came round with fresh batches of crippled plugs,

**Some Notes on Sparking Plugs.—**

and the results were similar to those of the first experiment. Another four dozen plugs were tested, and approximately 80% were suffering from a tendency to spark inside the cup, especially at medium and high engine speeds. The owner of a baby two-stroke brought in four plugs which he had discarded as past praying for. In each case they functioned perfectly under all our tests. The inevitable conclusion was that his newish engine is not yet perfectly run in, and that it gets so hot as to render the plug points incandescent and stops the engine through pre-ignition. All of us agreed that wherever a careless rider or a crude oiling system or a bad carburetter adjustment tend to make an engine dirty, the detachable pattern of plug is a great boon to the owner, because it can be cleansed so much more efficiently and readily than the cemented joint type.

ROAD RIDER.



ON THE SUMMIT OF "THE RIVALS."

Visitors to Carnarvonshire during the coming summer should make a point of journeying to "The Rivals" (Yr Eifls), those two mountains which stand as outposts to the Snowdon range. There is a road to the summit of one of these hills from which, on a clear day, the coast of North Wales may be seen as on a map.

## ON BALLS AND ROLLERS.

A FRIEND who rides a Scott is able to do twenty-eight miles without oil in his sump. He has evidently been served with pistons on the slack side—slacker by a good deal than the standard type. His engine is undoubtedly a cool runner, but though roller bearings would easily stand such usage without suffering the least harm, there is, unhappily, no such thing as a roller bearing piston! I too am riding a machine having roller bearings throughout, but it will not do half of eight miles without oil, far less twenty-eight. The rollers would stand it and any amount more, but immediately the pistons become dry, terrific friction begins and gradually becomes worse until, apparently, the pistons are red hot, and pre-ignition brings the machine to a standstill with most appalling sensations for the rider. I have possessed several water-cooled Scotts, and though one or two would run without water, none would run without oil. I know that my friend's engine will run without oil, but I think the roller bearings alone are not responsible for it, and riders possessing engines of a similar type would not be well advised to attempt similar feats. Standard machines are fitted with pistons on the tight side, partly for the sake of silence and partly on the score of wear; and a favoured few, who are not so particular about silence and wear as they are anxious to obtain terrific revs, may be given pistons of a special fit: and quite rightly so, since the demands of the respective parties are different; and this, more than the engine bearings, probably accounts for the abstemious disposition of the engine concerned.

Since, however, it is abundantly proved that ball and roller bearings require no more lubrication at the most than is supplied by an oil fog, here is a solution to the elimination of the splash system, which is quite hopeless when the cylinders are set at a wider angle than 90°. By taking the oil feed direct to the cylinder walls, utilising, perhaps, a hollow gudgeon pin, then draining it straight away from the sump, one would be sure of two well lubricated pistons, which is all that matters when plain bearings are absent. Unequal oiling would not occur, and the piston might be so shaped that a constant supply of cold oil would be circulating past it to be used again and again if so desired—thus assisting materially in cooling. Any mechanical pump, fixed in the bottom of the sump would do the work of feeding the oil at pressure to the pistons.

CHINOOK.

# A LIGHTWEIGHT T.T.

**The Real Lightweight comes into its Own. 250 c.c. Class, fostered by "The Motor Cycle," with the Special Cups for this Type of Mount in the 1920 and 1921 Races, to Compete for a Tourist Trophy of its own.**

A SIGNIFICANT announcement is made by the Auto-Cycle Union. The 250 c.c. class in the T.T. races is to have a Tourist Trophy of its own, and will no longer be regarded as a subsidiary class in the Junior T.T. race. Our efforts to bring this about date back to pre-war days, when we offered a cup for a real lightweight section in the T.T. races, as we felt that insufficient attention was being paid to a type of machine which had great possibilities.

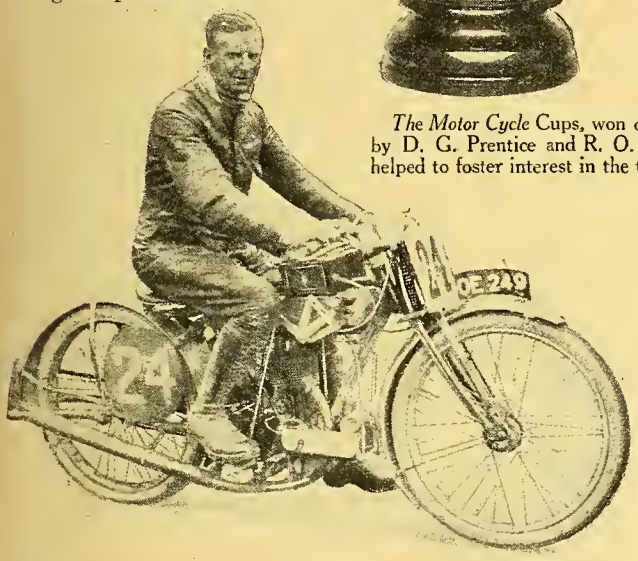
FORERUNNERS OF THE NEW TOURIST TROPHY.

*The Motor Cycle* Cups, won outright in 1921 and 1920 by D. G. Prentice and R. O. Clark respectively, which helped to foster interest in the true lightweight.

The seven entrants were:

R. O. Clark (2¼ Levis)
T. P. Lewis (2¼ Levis)
F. W. Applebee (2¼ Levis)
G. Kuhn (2¼ Levis)
B. Houlding (2¼ Diamond)
P. Pike (2¼ Diamond)
F. J. Price (2¼ Diamond)

It will be seen that the race was between two well-known lightweights of the two and four-stroke types respectively. The two-stroke won, R. O. Clark (Levis) finishing fourth in the event, and first in his class. His time was 4h. 55m. 37s. (38.31 m.p.h.) as compared to 4h. 37m. 57s. (40.74 m.p.h.), the time of the Junior Trophy winner.



D. G. Prentice, the winner of the 250 c.c. class in 1921, on a New Imperial four-stroke. Average speed, 44·8 m.p.h.

R. O Clark, on the Levis two-stroke, with which he won *The Motor Cycle* Cup in the 1920 Junior T.T. race. His average speed was 38·3 m.p.h.

When motor cycle competitions were revived after the conclusion of the great war, and at a time when the A.C.U. was interesting itself in the development of the scooter, we again urged better consideration for the small machine, and repeated our offer. As a result, the first post-war T.T. included a class for 250 c.c. machines, which competed for *The Motor Cycle* Cup, eventually won by R. O. Clark on a Levis.

### 250 c.c. Machines in the 1920 Race.

In this event (1920) seven machines not exceeding 250 c.c. capacity were entered, competing *(a)* against the larger motor cycles of 350 c.c. and *(b)* amongst themselves as a separate class for the cup presented by this journal. The interest manifested in the smaller machines and the speeds they attained confirmed our contentions that the genuine lightweight had a right to a "place in the sun."

### The 1921 Event.

For the 1921 Junior Tourist Trophy race, *The Motor Cycle* again presented a cup for the 250 c.c. machines, and this time no fewer than twenty-two entrants were received for this class out of the total of sixty-five. These entries were as follow:

D. G. Prentice (2¼ New Imperial).
B. Kershaw (2¼ New Imperial).
P. Pike (2¼ Levis).
G. Savage (2¼ Hobart).
N. Black (2¼ Omega).
A. Milner (2¼ Levis).
G. Kuhn (2½ Sun-Vitesse).
W. J. Lord (2¼ Hobart).
G. Denley (2¼ Velocette).
B. H. Morris (2½ Sun-Vitesse).
R. N. Judd (2¼ Velocette).
F. J. Price (2¼ Diamond).
F. W. Applebee (2¼ Levis).
J. S. Clayton (2¼ New Imperial).

**A Lightweight T.T.—**

S. A. Marks (2¼ Diamond).
R. E. Pugh (2¼ Levis).
C. H. Hopwood (2¼ Levis).
G. S. Davison ((2¼ Levis).
W. G. Harrison (2¼ Velocette).
H. Martin (2½ Martin).
R. Humphries (2¼ Velocette).
G. W. Jones (2¼ New Hudson).

The winner of our cup proved to be D. G. Prentice (2¼ New Imperial), who finished tenth after averaging no less than 44.8 m.p.h., 4 m.p.h. faster than the winner of the 1920 Junior T.T., thus proving that in twelve months great advance had been made in the development of the type.

Our purpose has been achieved. The Competitions Committee of the A.C.U. has decided that in future the 250 c.c. class is to be considered a separate race for a challenge trophy of its own, and we congratulate the Auto-Cycle Union upon its decision.

The race for this lightweight class will be run in conjunction with the existing Junior T.T. race, which is open to machines up to 350 c.c. engine capacity. Special scoring arrangements will be made in respect of the lightweight class, which will ensure that the performances of the lightweight machines throughout the T.T. race can be easily followed by the spectators, and that clearly defined results will be arrived at immediately after the contest. The new Tourist Trophy, to be held for one year by the winner, will be identical with the Senior and Junior trophies.

# THE TOUR DE FRANCE.

## A Trial of Nearly 2,500 Miles in Twelve Stages.

*(By "The Motor Cycle" Paris Correspondent.)*

A CHAT with M. Hamond, the energetic president of the Motocycle Club of France; cannot fail to give one the impression that everything necessary is being done to make the Tour de France motor cycle and cycle car reliability trials one of the outstanding features of the year. There is something in a Tour de France which appeals to every Frenchman, and, indeed, to every traveller in that country.

Before the days of railroads, every journeyman considered it a part of his education to make a tour round France on foot. With the bicycle period a Tour de France cycle race was organised, and is still continued. There have been several Tour de France car competitions, but this is the first occasion on which two-wheelers and cycle cars have been called upon to cover nearly 2,500 miles in twelve stages.

The President of the Motocycle Club de France believes that this event, which starts from Paris on March 25th and finishes in the same city on April 9th, will be the most strenuous motor cycle event ever held in France.

### Trying the Route.

Within a few days the President of the Club intends to go over the entire route on a six-cylinder Delage driven by the well-known race driver, Jean Chassagne, now with the Sunbeam Co., in order to arrange all organising details.

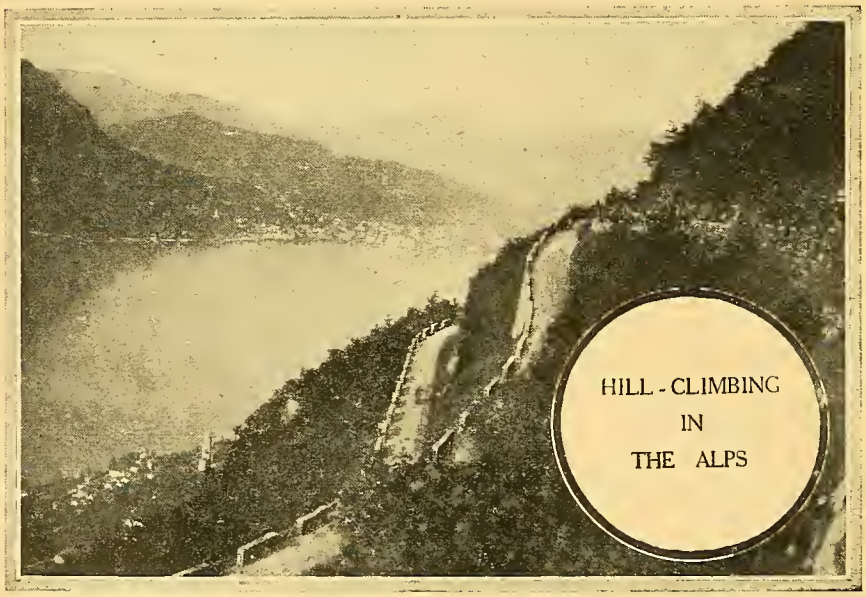
Starting from the capital on the morning of March 25th, the competitors will spend a night in the following towns: Caen, Nantes, Bordeaux, Toulouse, Avignon, Nice, Grenoble, Besançon, Strasburg, Rheims, and Lille. The average daily run will be 190 miles, but the longest stage will be the 233 miles from Nice to Grenoble through the French Alps. The road surface on this route is excellent throughout, but the climbs are such that any machine coming through without a loss of points will have given proof of real merit.

The object of a trial of this nature is not only to prove that a machine is sound and reliable, but also to bring that fact before the largest number of persons. It is on this account that exhibitions are being arranged at Bordeaux, Nice, Strasburg, Lille, and Paris, where the competitors will rest for one day. When not on the road, the machines will be under official control, and cannot be touched by either the competitors or the public. On this account, the firms taking part in the tour will be allowed to have on exhibition machines which are duplicates of those taking part in the competition.

### Varied Scheduled Speeds.

Classes provided for are motor cycles varying from 250 to 1,000 c.c., two classes of sidecar machines, and 1,100 c.c. cycle cars. Reliability will be the basis of the competition, with the loss of points for early or late arrival at controls. The average speed to be maintained will vary according to the class of machine, and also, to a certain extent, according to the route. The maximum will be 25 m.p.h. for the more powerful machines and 18½ m.p.h. for the lightweights, but it is practically certain, however, that this average will not be required for such a run as that from Nice to Grenoble. The decision to reserve the right to lower the average with only a few days' notice is really a wise one. It is quite possible, for instance, that the mountain roads may be in such a condition, by reason of snow or rain, that to maintain the maximum average would cause every competitor to lose a very large number of points.

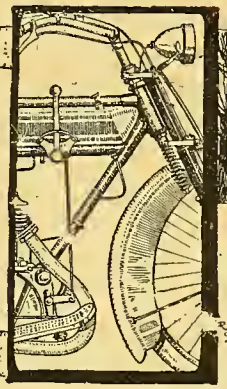
Although no official announcement has been made, it is understood that valuable cash prizes will be offered. The towns through which the competitors will pass are displaying considerable enthusiasm, and offers of money prizes are flowing in in a surprising manner. These cash prizes will, of course, be in addition to the club medals offered for the winner in each class. Entries at normal fees, 1,000 francs per machine, are received at the Motocycle Club headquarters, in Paris, until the last day of this month.



Magnificent views confront the tourist on the road above lovely Lake Lugano.

# MILES PER HOUR *v* GEAR RATIOS.

## A Plea for a more Comprehensive Statement of Capacity.



FOR a long time it has been the custom amongst motor cycle manufacturers to quote their gears in terms of the ratio of engine revolutions to turns of the driving wheel. This did not leave so much to the imagination in the case of pre-war motor cycles, as nearly all had 26in. wheels, whereas present-day machines differ in size from 24in. to 28in., nominal sizes, by the way, which are not always actual.

The method of stating the gear of a pedal cycle is certainly better, for account is taken of the size of the wheel as well as of its speed of revolution, and accurate comparison may be made between two different machines without having to look up further information.

Before going further I will admit that the length of the cranks will affect the foot pressure which the rider must exert to climb a given hill. Still, a gear of, say, 75 will always mean that one revolution of the crank bracket and pedals will propel the machine exactly the distance travelled by a wheel 75in. in diameter during one revolution.

### Pedal Cycle Gears applied to Motor Cycles.

Treating a motor cycle gear in the same way we find that the gears of a machine having 26in. wheels and being 5.2 to 1 on top, 8.6 to 1 on middle, and 13 to 1 on bottom gear, would, in push cycle parlance, be geared to 5, 3, and 2. In other words, a man can push a gear of 75, while the limit of a 2¾ h.p. engine is about 5, or one-fifteenth of the man's capacity.

There is, of course, another side to this question, for when the speed of the human and the petrol engine is compared the advantage is no longer with the former, but immeasurably in favour of the latter. Briefly, the petrol engine gets its power largely from its speed. Here I come to the second disadvantage of the method in common use.

### Normal R.P.M. should be Noted.

Although petrol engines as a whole are high-speed engines, some are able to turn over very much faster than others. For instance, the small flat twin has wonderful "revving" powers. Therefore, before a statement that the gear is 5 to 1 can convey any definite information we must ascertain two other facts, viz., the size of the driving wheels and the normal speed of the engine.

Some engines are made to "rev" at high speeds. "Revving" does them no harm, but slogging along on a high gear would pull them to pieces. Obviously such engines should have a much lower gear than the big single, not because they are less powerful, but because they exert their power in a different way.

### A Case in Point.

In these notes I do not wish to urge the virtues of any particular machine; but suppose an A.B.C.—a fairly heavy machine with a small engine—and a 4 h.p. Triumph of a somewhat similar weight (a difference in the weights of the riders may make the total weights identical), be ascending a steep hill side by side, obviously both engines will be exerting the same horse-power, but it is probable that the A.B.C. will be running on a lower gear than the Triumph. I have selected these two machines as an example because both are admittedly in the first class, but I do not intend to try to prove that one is better than the other.

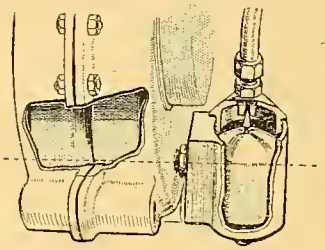
### M.P.H. the Best Basis of Comparison.

Generally speaking, what most concerns a rider is that he shall get good results in speed, power, and mileage from the petrol consumed, and it does not matter very much to him whether speed is the result of high revolutions per minute combined with a moderate gear, or is produced by a high gear and a powerful thrust. Horse-power is not a measure of any particular force, but simply a rate of doing work. One horse-power may be exercised in the lifting of 550 lb. 1ft. in one second, or 1 lb. 550ft. in the same time, or, again, 50 lb. 11ft., and so on.

Therefore I would urge the general adoption of stating the miles per hour obtained at normal engine revolutions when the various gears are engaged. This would give a satisfactory basis of comparison without further calculations. Thus two machines having the same figure for their top gear might be expected to be equal in performance.

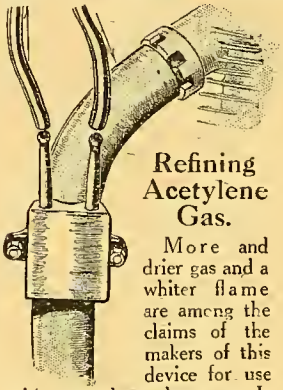
A figure of 30 might be obtained from an engine whose normal revolutions per minute were 1,750 geared 4½ to 1, or an engine having 2,150 as its normal r.p.m. with a gear of 5½. It would, however, be absurd for a rider to expect the same performance on hills from the latter engine with the gear of the former, as its figure would then be 39; and obviously a machine geared to run at 39 m.p.h. on the level at normal "revs" is more highly geared than one which is set to do 30 only.

It is, of course, only when the engine power is approximately the same in both cases that this figure can form a perfectly fair basis of comparison, and a low figure must not necessarily be taken as indicative of good performance on hills; it may be the result of a small engine suitably geared. AURIGA.



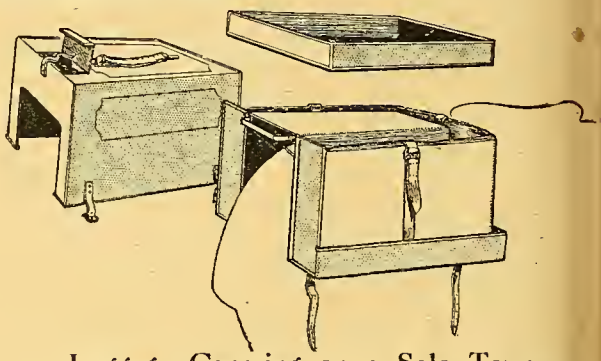
## Simple Automatic Lubrication.

Sight-feed, drip valve, and force pump, are all dispensed with on the Jebon gravity feed lubricator. Oil level in the crank case is maintained by a cork float and needle valve in an adjacent chamber, to which the oil is led by gravity from the tank (The Jebon Press Works, 2, Temple Sheen Road, East Sheen, London S.W.14.)



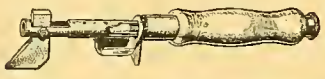
## Refining Acetylene Gas.

More and drier gas and a whiter flame are among the claims of the makers of this device for use with acetylene lamps. It simply consists of a chamber (clamped to the exhaust pipe) through which the gas passes. (The Star Equipment Co., 9, Baronsmere Road, E. Finchley, London, N.2.)



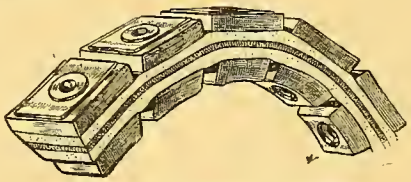
## Luggage Carrying on a Solo Tour.

The solo tourist's luggage problem has been carefully considered by T. Robini, 1, Tulse Hill, Effra Road, Brixton, London, S.W.2, with the above result. The lid (shown on the left) for this "pannier trunk" contains an accessible compartment for small tools.



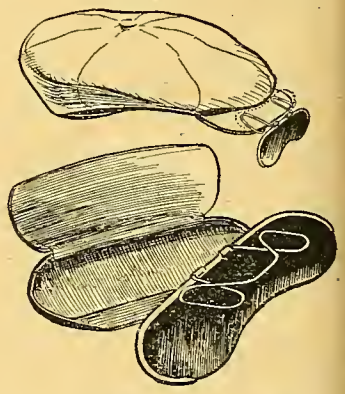
## Self-contained Soldering Iron and Blow Pipe.

This ingenious soldering iron uses methylated spirit inserted through the filler cap at the end. A priming trough is incorporated; if it is desired to use it as a blow lamp only, the copper bit may be removed. (Bancroftian Co., Ltd., 64, Bishopsgate, London, E.C.)



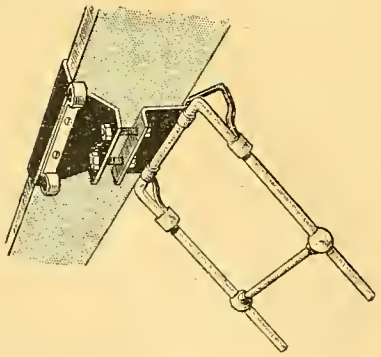
## Belting for Wet Weather.

For continuous riding in wet weather, a leather belt is much preferable to one of the rubber variety. An old established type brought up to date, the Service Super belt is composed of strips of chrome leather with tan hide blocks top and bottom, and is eyeletted for easy adjustment. (The Service Co., Ltd., 289, High Holborn, London, W.C.1.)



## Anti-dazzle Goggles.

Intended to clip on the peak of the cap, this blue glass screen may be pulled down to shield the eyes when meeting a dazzling pair of head lamps. (A. W. Gamage, Ltd., Holborn, London, E.C.1.)

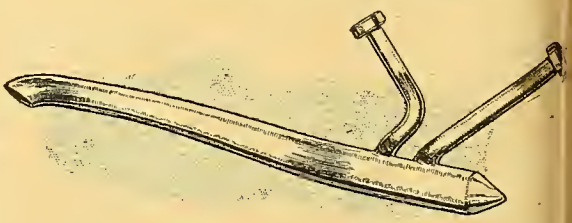


## Easily Fitted Prop Stand.

It is unnecessary to drill holes to fix this prop stand, since it simply clamps on to the footboard. When out of action it lies snugly underneath. (Mowbray, Bellairs and Co., 24, Little Chester Street, Belgrave Square, London, S.W.1.)

## Finding "Top Dead Centre."

Amateurs who desire to time or re-time their own engines will gain considerable assistance from this plug-locating device, designed to screw into the compression tap hole—provided that the tank rail does not come in the way. (P. S. Collyer, 78, Snell's Park, Upper Edmonton, London.)



## "Zoom! Zoom!!"

Thus happily has this very handsome copper exhaust system for 2¾ h.p. Douglases been named. No back pressure, a pleasing exhaust note, and an improved appearance to the machine at a moderate cost (30/-) are the claims of the maker—W. G. Coram 140, Victoria Street, Bristol.

# Club News

### Coventry Triangle M.C.

At 6 p.m. on Saturday next, at the Railway Hotel, the club will hold its first annual dinner.

### Yorkshire Centre A.C.U.

The first annual general meeting of the centre will be held at the Hotel Metropole, Leeds, at 7 p.m., on Monday, February 6th.

### Slough and District M.C. and L.C.C.

The first general meeting of the club will be held at the Old Crown Hotel, Slough, at eight o'clock to-night. All those interested are invited to attend.

### Bucks County M.C.C.

Mr. G. Burch, 108a, Oxford Road, High Wycombe, is now secretary of this club, which recently held an extremely successful dinner at the Red Lion Hotel, High Wycombe.

### Western M.C.C. (Glasgow).

The annual dinner and prize distribution will be held at the Athenæum Restaurant, Buchanan Street, on Friday, February 3rd; reception at 6.45 p.m., dinner at 7 p.m.

### Surbiton and District M.C.C.

Other London and south-country clubs are asked to note that the inter-club team trial for the Maudes Trophy has been fixed for April 22nd. It is hoped that this early notice will prevent any clashing of dates. The annual general meeting of the club will be held on Wednesday next.

### South Midland Centre A.C.U.

Some seventy members were present at the recent annual meeting at Bedford, when the following officials were re-elected: President, Mr. A. J. Salmon; chairman, Mr. H. J. Pooley; vice-chairmen, Mr. W. A. Mathews and Mr. S. R. Axford; treasurer, Mr. A. Humphriss; and auditors, Messrs. B. Staley and R. J. Pigott.

### Westmorland M.C.C.

When the club held its annual meeting at the County Hotel, Kendal, on Friday, January 6th, the room was overcrowded. The president, Captain R. Rainshaw Rothwell, was unable to be present, and Mr. Bryan Jefferys, the popular captain of the club, was called upon to take the chair. Mr. W. D. Stewart presented the secretary's report, which was of a very satisfactory nature. It also referred to the loss the club sustained by the death of Mr. Guy Jefferys, but struck a distinct note of cheerfulness for the coming season. Captain R. Rainshaw Rothwell was unanimously re-elected president of the club. Mr. Malley, who for the past year had been assisting the secretary, was appointed to that office. Mr. J. P. Johnson was appointed treasurer, and Mr. W. A. Carter trials secretary.

### North London M.C.C.

A very successful and enjoyable dance was held recently at Fairfax Hall, Harringay. It was very well supported, there being an attendance of nearly 300. The opening run for this year is being held on Saturday, February 25th.

### Surrey M.C.C.

At the annual general meeting, which took place at the White Horse Hotel, Guildford, on January 11th, the hon. secretary's report showed another successful season and a very satisfactory increase in membership; the balance-sheet disclosed an excellent financial position, as a result of which it was decided to reduce the subscription to 12s. 6d., including A.C.U. affiliation under Division A. It was also decided to change the name of the club to the Surrey Motor Cycle and Light Car Club. The annual dinner will take place at the Prince of Wales Hotel, Guildford, on January 21st. Tickets 6s.

## THE SCOTTISH SHOW.

**Next week's issue of *The Motor Cycle* will contain an Illustrated Guide to the Motor Cycle Exhibits at the forthcoming Scottish Automobile Show.**

### Harrow and District M.C.C.

Owing to the large number of enthusiastic local motor cyclists, a club has been formed as above, with headquarters at the Swan Hotel, Sudbury. Having Professor A. M. Low as president, it has made great strides since its formation, chiefly owing to that very enthusiastic gentleman. The annual subscription has been fixed at half a guinea, plus affiliation fee to the A.C.U. under Division A, thus making 12s. in all. A club meeting is held every Thursday at 8 p.m. in the club hall, in which many enjoyable evenings have been spent. Any motor cyclists or light car owners who would care to join are cordially invited to do so, and should write to the hon. secretary, Mr. P. W. Harris, 25, Copland Road, Wembley, N.W.

### Bury and District M.C.C.

A motor cycle club, now called the Bury and District M.C.C., has been restarted at Bury St. Edmund's. The subscription is 10s. 6d., and at the present time there are about sixty members. It is hoped to arrange some runs and competitions with other clubs in the neighbourhood. Those interested should communicate with the hon. secretary at the headquarters of the club, the Suffolk Hotel, Bury St. Edmund's.

### Westoe M.C.C.

Owing to the success of the club, it is proposed to alter the name to the South Shields and District Motor Cycle Club, and a cordial invitation is extended to all prospective members in the neighbourhood of South Shields.

The annual general meeting will be held in the Regent Hotel, Ocean Road, South Shields, at 7.30 p.m., on Tuesday next.

### Bohemian M.C.C. (Southampton).

This newly formed club held its opening event of the year on New Year's Day, when a very representative gathering assembled at West Dean Hill, a well-known test hill of the district. The results were as follows:

SOLO CLASS.—1, C. S. Broomfield (4 Blackburne); 2, A. H. Saunders (7-9 Harley); 3, R. Mines (4 Kynoch-Jap).

SIDECAR CLASS.—1, M. Angel (8 Enfield sc.); 2, E. F. Crabb (4¼ B.S.A. sc.); 3, P. G. Smith (4¼ B.S.A. sc.).

The next meeting is on February 5th to Whitchurch; members are requested to meet at the Cowherds at 10.45 a.m.

### Tiverton M.C. and L.C.C.

A highly satisfactory state of affairs was reported at the first annual meeting, held at the Palmerston Hotel, Tiverton, on Thursday evening, under the chairmanship of the president (Capt. J. H. Amory). The membership was stated to have reached 108, which, with the substantial balance in hand, was considered very gratifying in view of the fact that the club is only six months old. Humour and optimism characterised the speeches at the first annual dinner, which followed. Mr. A. Thorne took the chair, being supported, among others, by the Mayor (Mr. W. Barrows).

### Northern Centre A.C.U.

The annual meeting was held at the County Hotel, Kendal, on the 8th inst., when Mr. Rutherford, of Carlisle, presided over a large attendance. All the clubs in the Centre were represented, with the exception of Kirkby Stephen and Lancaster. Considerable discussion took place as to which club in the Centre should hold the only open event which was to be held in the district. It was stated that the only club which had sent an application to hold the fixture was the Cumberland County body, but several members expressed hope that the Cumberland club would be granted no privilege on account of applying first when the matter came up for consideration. Mr. Stalker thought that meeting should have power to say who was to hold the event, and deplored the fact that the Centre had no standing orders of its own on the matter. Mr. J. Hall and Mr. W. A. Carter both spoke on the claims of the Westmorland club, but the A.C.U. Consul for the county (Mr. W. D. Stewart) thought it would be far better to leave the matter with the new board.

# THE GREAT GAME.

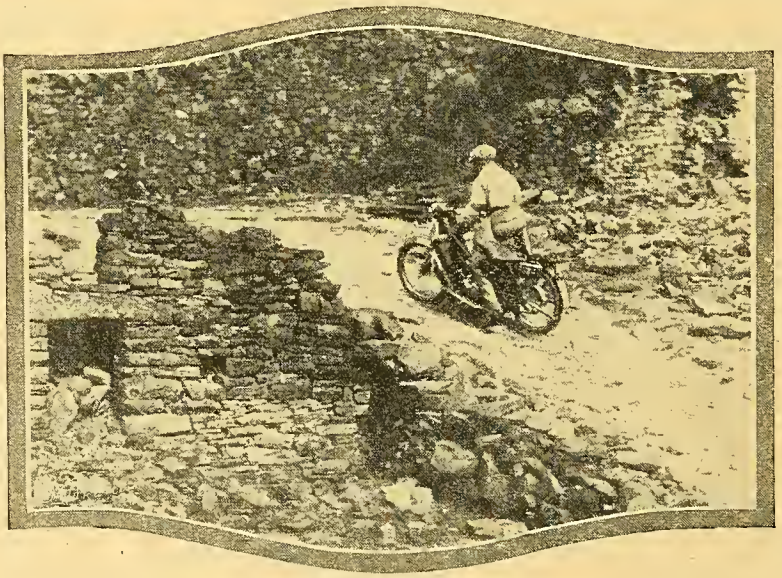
## Being a Plea for the Greater Support of Sporting Trials by Private Owners.

WHAT is the fascination of the freak trial? Comparatively so few private owners (and even trade riders) enter for such events that the question is a natural and recurring one. On behalf of the select few "mad-men" I will endeavour to frame a reply.

Perhaps this may best be done by comparing the sporting scramble with the other varieties of competitive events at present open to the motor cyclist.

### The "Slowness" of Speed Trials—

There is the speed event, which sounds exciting, but is not very. If it be important and "open," poor Mr. Private Owner stands little chance of being placed — even in the "experts barred" classes, for "experts" have a peculiar habit of mislaying their honourable designation after a short, very short, abstention from competition work, blossoming forth as very raw "novices" just when one least expects them. Then, "experts barred" usually refers to riders and not to machines; factory-tuned 'buses that arrive in a lorry usually mean business—and do it.



". . . For it is driving ability—and luck—that counts!"

### —and of Hill-climbs.

Very much the same thing, unfortunately, applies to the closed club event, if it be worthy of attention at all; and even if the meeting be confined to *bona fide* private owners on their own machines, there is not very much fun in streaking along a measured kilometre perhaps three-fifths of a second slower than the speediest man when one knows that the time-keeping may easily have a possible error of one second.

Nowadays, the average hill-climb is simply a speed event on a safe up grade. Hair-pins in hill-climbs are distinctly out of fashion. Therefore, all the foregoing objections may again be applied.

Of serious competitive events there only remains the reliability trial, of which, as the schoolboy's essay would say, there are two

**The Great Game.—**

An animated scene on Park Rash, where a clean climb is its own reward

kinds. One relies on split seconds timing and secret checks to place the winners; the other, on rough going.

Perhaps there is, indeed there must be, a class of motor cyclist which enjoys riding at a monotonous 20 m.p.h. over fair to good roads, with one eye on a watch and the other dangerously alternating between the road ahead, the route card, the speedometer, and the milestones (N.B.—The reference is somewhat exaggerated metaphor; actually one need not be cross-eyed.)

There remains the freak event—it varies greatly in severity, but it is always sporting—and having shown, I hope, why it persists so strongly, I will endeavour to disperse one or two illusions held by those who have only read or watched a *real* trial, in the hope that it will gain even greater popularity.

### Who Minds a Bruise or Two?

"Machine-smashing" is a favourite epithet of those who know not. Well, it depends on what is meant by the term. If kinked rims—and sometimes buckled wheels—twisted footrests, and missing mudguards singly or collectively entitle a machine to be called smashed, they are right. But it is only very rarely that a sturdy modern big single or twin gets damaged irreparably, even in the "Scott Scramble." Admittedly, the task of annexing "freak golds" on a lightweight is best left to the trade rider financed by the factory; for the majority of lightweights, excellent though they are, may crumble up some of their essentials at about the third crash. On the other hand, with a good hefty heavy or medium weight machine the inevitable spill does remarkably little mechanical damage. And who minds a bruise or two?

### Driving Ability—and Luck!

"Dangerous to the rider" is another common objection. Now while the spice of danger is perhaps what makes things really worth while, it is more illusory than actual. I doubt if it is any more dangerous than main road riding; boulder-strewn tracks, ruts, watersplashes, and greasy grades of 1 in 3 make high speeds impossible—and serious accidents, as a rule, only occur at high speeds.

Entered in the right spirit, the sporting trial provides much fun. For it is driving ability—and luck—that counts!

A. McL.

'. . . boulder-strewn tracks, ruts, watersplashes, and greasy grades of 1 in 3 make high speeds impossible.'

### *WHO WOULD DECIDE?*

Sir,—Might I ask you to use the influence of your paper to secure that when the new Bill is introduced making rear lights again compulsory riders will *not* be punished when it can be shown that the rear light had merely "jolted" out?

Stafford. W.K.

### *"BUYING A PIG IN A POKE."*

Sir,—"Have you seen our new so-and-so model?"

The above phrase, so often coined by motor cycle manufacturers for insertion in their advertisements, seems to me to be somewhat out of place, and for this reason, that some of the firms never seem to trouble about supplying their agents with demonstration or Show models of any description. Why is this? OLD READER.

Leicester.

### *MOTOR CYCLISTS IN DREAMS.*

Sir,—Your correspondent Maude Stanfeld is perfectly right in her (or his) assertion that by concentrating and holding the image of our desire in mind with persistency, the thought will materialise, provided the desire is reasonable and good.

Your correspondent, however, makes one very serious omission. She should have qualified her statement with the condition that the thought should be backed by the consciousness of good in thought and deed. Otherwise, not a bolt or nut will materialise, much less a bicycle. This fact is again becoming common knowledge, and is a thousand years old (*vide* the Scriptures), and, of course, applies to all things in daily life. W.H.M.P.

London, E.11.

### *T.T. RACES FOR PRIVATE OWNERS.*

Sir,—The suggestion recently advocated by various readers of having a T.T. for private entrants is certainly an excellent proposal from the point of view of the large percentage of the sporting class of the great pastime. There are, however, some points that I would like to point out on this matter. First, could permission be got from the police to hold a race on the roads of, say, the North of England, a point accessible to both Scottish and English motor cyclists? If the necessary permission were granted, or some benevolent person owning an estate gave permission to use his park for the race, then different classes must be settled upon, a scale of which I lay out here:

CLASS 1. *(a)* Lightweights not exceeding 250 c.c.; *(b)* lightweights not exceeding 250 c.c., and of not later origin than 1917.

CLASS 2. *(a)* Mediumweights not exceeding 350 c.c.; *(b)* mediumweights not exceeding 350 c.c., and of not later origin than 1917.

CLASS 3. *(a)* Motor cycles not exceeding 500 c.c.; *(b)* motor cycles not exceeding 500 c.c., and of not later origin than 1917.

Of course, some other person more versed in matters of this description will no donbt be able to offer some other table for entrants, but I think that owners owning machines over five years old ought to be allowed for, as it would be unfair to compete with more modern 'buses.

It is certain that a large number of entries would be made, so that the scale of entrance fees would be correspondingly low. Perhaps a class could be arranged providing for the novice, such as myself, of, say, an age ranging between fourteen and eighteen.

This somewhat elaborate scale of the private entrants' T.T. will undoubtedly be met with some disapproval, but I hope that some definite arrangement may be come to.

REX W.DUNCAN.

Sir,—In your issue of December 22nd, 1921, I notice a letter from three private owners advocating a purely private owners' T.T. race. I must say this idea appeals to me very strongly, but how it is to be worked is another matter. Some great central body such as the A.C.U. would have to take the matter up, and be responsible for every item in connection with the race—that is, if the entrants are to be drawn from all parts of the United Kingdom, as in the Manx T.T.

Perhaps it would give the three gentlemen who advocate such a race some encouragement in their project, and also interest other of your English and Scottish readers, to know that inside the last three months we have held no fewer than four road races in Ulster. Three of these took place within ten miles of Belfast, and the other about twenty-five miles from the city.

Two of these races were held over a course twenty-five miles long and two over a course of fifty miles, the laps being about five to six miles. The races were run on the handicap principle, as a number of trade riders competed, and also because a number of 350 c.c. machines entered. I myself saw three of these races, and the interest taken by both the motoring and ordinary public was tremendous. The police and club officials kept the course clear in a highly praiseworthy fashion, and the spectators responded by co-operating with them, and gave the riders every chance.

The road approaching the dangerous corners was bannered, much after the fashion of the I.O.M., and all care was taken to minimise the chance of an accident. The use of crash helmets was not enforced, although several of the riders wore them. Of course, one would rather see this means of protection more universal, but it does not always pay to be too rigid, especially when 60% to 70% of the riders are private owners.

These races had the touch of the I.O.M., inasmuch as three of the 1921 T.T. entrants took part.

Belfast. SPORTSMAN.

### *MYSTERIOUS TEMPORARY SEIZURE.*

Sir,—In reply to the letter from the M.A.G. Engine Co., Ltd., published on the 22nd ult., I should like to mention two experiences which I had of temporary "seizing up" with a four-stroke single, which could hardly have been caused by pre-ignition.

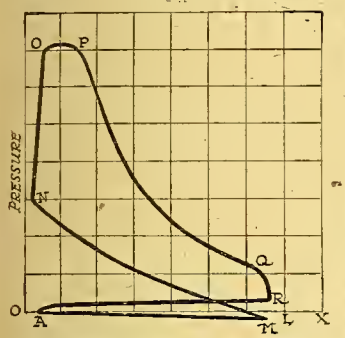
On the first occasion the machine had only been three weeks on the road, and all the adjustments were correct and lubrication liberal. I was not using a mica-insulated plug, and its only point was the stout electrode curved to form the gap with the outer portion. The engine seized up without warming after about two miles at 25-30 m.p.h., and although I raised the exhaust valve immediately, the machine came to rest with the back wheel immovable. On depressing the kick-starter I found the engine quite free, and rode on without delay.

Several weeks later, after decarbonising, I tried the machine "all out" on a lonely piece of straight road, using the same plug, and this time over-oiling considerably. The same thing happened, but at close on 50 m.p.h. (Bonniksen). Being prepared for a possible repetition, I had my hand ready on the exhaust lifter, and raised the valve simultaneously with the stoppage of the engine; but the cycle slid

along for a considerable distance with the rear wheel locked, and came to rest, fortunately still upright. Restarting was simplicity itself, the smoky exhaust testifying to the adequate oil supply. I fail to see how a premature explosion could continue in effect after the exhaust valve was raised, and I am not inclined to blame the plug, as another of the same type served very well in a far hotter engine than the one mentioned above. WALTER B. PENNY.

### *MISLEADING HORSE-POWER RATINGS*

Sir,—I think that "Speedwell" and others are unfair in their criticism on the above subject, and I will endeavour to give the reasons why. The i.h.p. of an internal combustion engine is shown roughly by the annexed figure, which is the indicator diagram of that type of engine. AL is a datum line showing atmospheric pressure, the curve AM is the charging stroke, MN is the compression stroke, NOPQR is the explosion stroke and expansion stroke, and RA is the exhaust stroke.



Indicator diagram for an internal combustion engine referred to by "South Wales."

In a perfect engine, the indicator diagram will have no round corners, as shown at O, P, and Q. Obviously, the bigger in area this diagram becomes, the more will be the work obtained from it. This is only possible by having the valves working perfectly—no sluggishness and rebound—and the compression must be good. Hence from this we see that it is quite possible to have two engines of the same capacity, and yet the diagram of work done in the cylinder will be totally different, and hence the i.h.p. will not be the same. The i.h.p. depends upon the mean effective pressure, and hence the wider is the section QR, and the further away is OP from AL the greater is the i.h.p. Again, if the i.h.p. were the same in both cases, a great deal depends on the weight of the piston, the balancing of the flywheels, and the resistance to motion due to friction in the bearings. Therefore the capacity of the engine is no indication of its b.h.p., and it is this which counts to the motorist, not the i.h.p. The h.p. can only be found practically by means of the brake test, which is described in any textbook on engines, and any formulæ which may be devised only give approximate values. SOUTH WALES.

Treorchy.

[We think that "South Wales" rather misses the point both of our article and previous correspondents' letters. The fact that two engines of the same capacity may give widely different i.h.p. is no reason why they should not have the same nominal ratings; the more efficient unit will automatically get its fair share of credit.—ED.]

### *FUEL ECONOMY ON A TWO-STROKE.*

Sir,—I ride a two-stroke from necessity rather than choice, and the letter in your issue of December 29th, 1921, from Mr. Raymond B. Porter caught my eye. He boasts of obtaining 140 m.p.g. as an average consumption on a two-speed O.K.-Villiers. My machine is a single-speed of the same make, bought July, 1921. I was able to check the consumption on a run from Norton Bridge (Staffs.) to Ramsgate during August. The distance is 240 miles, accomplished in thirteen hours, including going through London. I filled up, having started with full tanks, at Daventry, London, and at Canterbury, the amount being half a gallon each time. The last occasion exactly refilled the tank, *i.e.*, 205 miles on 1½ gallon=136 m.p.g. That is not quite so good as Mr. Raymond B. Porter can do, but that was when the engine was new: now, riding every day in all weathers, at no less than eighty miles per week (and generally much more), I can go as much as 426 miles on a two-gallon tin. I keep my records very carefully, and can vouch for this statement. 213 m.p.g. "How is it done?" some will say. I have stated that I am a two-stroke merchant from necessity rather than choice, and I will part with my "secret" for a Scott-Squirrel! WINKLE.

Burslem.

### *ASSEMBLED MACHINES.*

Sir,—We have read with interest the article on "Assembled Machines," by "Ixion" in his weekly contribution "Occasional Comments."

If we understand "Ixion's" meaning rightly, he recommends his readers to purchase assembled machines, pointing out the following advantages:

A. Cheapness.

B. Standardisation.

C. The embodiment into the construction of the machine of individual wishes.

Far be it from us to criticise adversely the productions of any competitor, be he "assembler" or manufacturer of a "special design." We must, however, take exception to a regular contributor of *The Motor Cycle* drawing comparisons between two classes of manufacturers, and arriving at a conclusion prejudicial to the large manufacturer, to whose efforts is due the establishment of the motor cycle industry, who gives employment to thousands of men, and has invested in his undertaking a large amount of capital.

The success of *The Motor Cycle* as a paper is not due to the assembler, but to the manufacturer, who took great risks when the successful establishment of the motor industry was despaired by most. There is not a single advantage enumerated by "Ixion" that the large manufacturer cannot give; but the greatest advantage he can give to the rider your contributor does not mention. It is the employment of men of brains who give their whole power and being to the continuous improvement of the article which they design and manufacture. TRIUMPH CYCLE CO., LTD.

EDWARD G. FIRKIN, Advertising Manager.

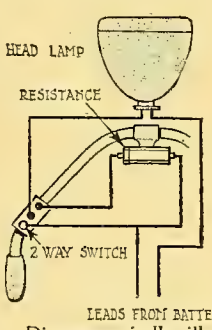
### *HEAD LAMP DIMMING ETIQUETTE.*

Sir,—I am sending details of a lamp dimming device I have had in use for about nine months, which anybody using electric lighting can make for next to nothing.

The device is a simple form of resistance composed of a few feet of "flower wire" (thin iron wire) as sold in penny coils.

The exact length is found in a minute with the accumulator on the bench, connected up with a bulb. A length of the iron wire is introduced into the circuit until the required amount of dimming is obtained and the length noted.

This length of wire is then wound round a piece of fibre or mica, taking care, of course, that the resistance is not short-circuited by the turns of wire touching at any part. This is covered each side with a piece of mica, and the whole wrapped round with asbestos string, so as to fit tightly into a metal shaving stick case, leaving the wire end, which must be carefully insulated, projecting through holes in the top and bottom of the tin. A little pram tyre cement makes a water-tight job of these holes, and the resistance can be clipped to any convenient part of the head, and enamelled to match the machine.



Diagrammatically illustrating Mr. A. Handford's home-made dimming arrangement. (See accompanying letter.)

A small two-way switch should be fitted to the handle-bar in such a way that it can be operated without shifting the grip, and the connections made as in the diagram, the leads being run through the handle-bar for neatness.

I got my switch from Messrs. Hunts, Tunstall Road, Croydon. It cost, I think, 2s., and is about the neatest thing of its kind, and has withstood some severe soakings.

Mr. Hunt (himself a Norton rider) recommended me to use a four-volt bulb on a six-volt accumulator, which I find completely successful. I have used several different kinds of bulbs, but have never had one burn out.

In my own set, on a Matchless sidecar outfit, I use a four-volt one ampère bulb with a six-volt sixty-hour accumulator, and find 30in. of wire correct for the resistance. Six-volt miniature screw bulbs are used for side and tail. Four-volt two ampères can be used in the head lamp, but they do not appear to give an appreciable amount of extra light, while they increase the load on the battery.

This fitting enables one, without effort, to observe the courtesy of the road. ARCHIE HANDFORD.

### QUALITIES OF THE SPARK GAP.

Sir,—Will you please permit me, one who knows just enough about electricity to press the button and hope for the best, to ask an anti-spark gap expert to explain why it is that the Amplos people have received a letter from the London County Council saying that since Amplos had been used on their lorries their petrol consumption had decreased by a definite percentage (I forget the figure)?

EDWARD DUNNE.

### TOLLS AND HOW TO AVOID THEM.

Sir,—With reference to "Ixion's" note, if his correspondent goes to Shoreham *via* Steyning, I can help him. He need not go over the Norfolk Bridge at all! When he turns to the left at the end of Steyning, and has the long straight slope down to Bramber Railway Station facing him, he turns immediately sharp to the right, past some villas on the left, and bearing right at the fork. He then follows a narrow winding lane, past Coombs and Botolphs, and comes out eventually on the upper Brighton-Worthing road at the Sussex Padd. There he turns right, and after 100 yards or so takes the road to the left over the old Aviation Ground, under the railway line, until he strikes Bungalow Town.

It is a charming five miles, easily deciphered on a good map, and the road surface, instead of being vile, is quite good.

Of course, if his way takes him through Brighton, there is nothing in it.

There is a right of way across the Aviation Ground, and he need not listen to any person who says otherwise.

By the by, has he ever tried to get from Shoreham to Southampton *via* Chichester? He will there find himself twice mulcted of 1s.—once over Burseldon Bridge and again over the ferry at Southampton.

The joke about the Norfolk Bridge is that, whilst your 6d. is taken for passing over, there is no guarantee that you will not break the bridge down in your attempt!

It is also worth while remembering that if it is convenient to you to use Old Shoreham Bridge instead of the Norfolk, the charge is only 4d. return.

CUTHBERT WILKINSON

### CONSTRUCTING A SUBTERRABRAINWAVEIUM!

Sir,—I have been much impressed by the kind attention to details that you give in answering what would appear to be, in many cases, difficult questions, and, though I feel it to be rather a selfish demand on your valuable time and space, I am in hopes that you might be able to help me in a little undertaking of mine. As there seems to be a vast amount of sewage space literally crying out for a fuller use, I intend to endeavour to construct a subterrabrain waveium, and the following are the points on which I solicit your kind advice:

(1.) Would a 1914 Auto-Wheel develop sufficient power to propel it?

(2.) Would you suggest fourteen or sixteen blades to the propeller or paddles?

(3.) Should they be forged steel or cast iron, as I propose to make them of material 4×4in. or 8×8in.?

(4.) Would you suggest a pilot jet or just an ordinary rudder for purpose of navigation?

(5.) Is duroleum preferable to linoleum or paper saturated with petroleum the best material with which to construct the watertight compartments?

(6.) How often would you propose I should take up the bearings, and, as there seems considerable controversy on the subject, I want to "get well down to it"?

(7.) Which, in your opinion, is the best dual-purpose contrivance on the market to serve as diving-bell and state cabin?

(8.) When ordering my rubber boots, have I to state the size of my feet or the size of the boots?

(9.) What would happen if I reversed the figures?

(10.) How much would the driving licence cost to one who is habitually sparing with the soda on principle?

(11.) Would it be necessary, absolutely, to have a tank when there are such excellent feeding bottles to be procured at a much smaller cost?

(12.) Could you descant on the value of its imperishability with relation to the nebular hypothesis?

(13.) As I propose to construct it to bend in order to negotiate sharp corners, could you advise me as to the most suitable hinge on the market?

(14.) As I also propose to make the frame of 12×12in. pitch pine, would you recommend adhesive tape or just ordinary tinned tacks for the joints—it is to be annealed in any case?

J. A. CHEEK.

### POSSIBILITIES OF AN ENGINE PATENT.

Sir,—I was greatly interested in your illustration of Messrs. Snarry and Bullows engine patent on page 883 of a recent issue of *The Motor Cycle*. It seems to suggest extraordinary possibilities, among others the following:

(1.) A flat, rounded, or concave piston head is for the first time rendered possible on a two-stroke engine.

(2.) The piston head could have sufficient weight of metal towards its outer circumference to allow of a very large diameter automatic inlet valve being employed. Such would ensure a cool piston without adding greatly to the weight.

(3.) Two exhaust ports of large area would be available, as the transfer port would not be required.

(4.) The use of two short simple slides to close the exhausts after the maximum amount of opening would effect a great economy in petrol consumption, and admit of a *greater volume* being compressed. A short sleeve could be used if more convenient. Either would be external to the cylinder bore. The crank case compression could be secured by covering the slots, and carrying the actuating spindles through gas-tight gland right down to the cams, which would be formed on the main shaft between the crank web and the main bearing. Flat springs rectangular to the crank could be used for the return. The usual sleeve crank would not be suitable for quick closing. Everything would be well oiled and relatively simple to manufacture.

(5.) And this is more conjectural. No. 4 would render possible, if so desired, the retention of sufficient burnt gas to damp the incoming charge. This with a view to the employment of a much higher compression ratio. Possibly such a charge would be slow burning, but such an engine should pull well and show great economy. In any case, the two-strokes extra explosion, coupled with the extra compression heat, would make high revs. undesirable. Of course, two-strokes as we know them need no damping, but better scavenging.

EMM TEE.

Glasgow.

### ENCOURAGING INVENTIVE GENIUS.

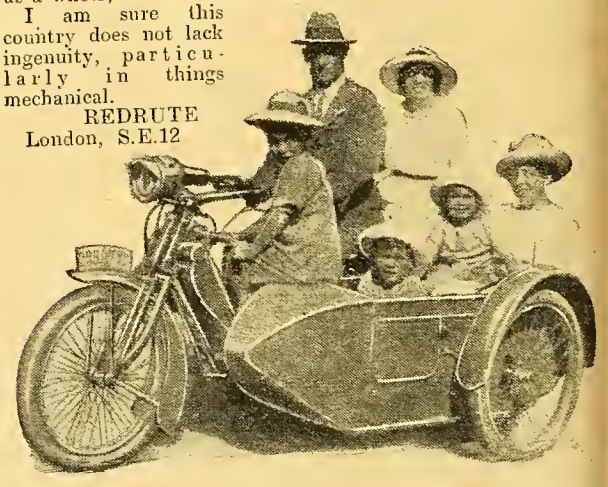
Sir,—As an enthusiastic motor cyclist with some original practical ideas, I am wondering if there are any firms in this country who are enterprising enough to help persons like myself.

I suppose there are many men who have really original and valuable ideas who have not the money or opportunity to work their inventions up into a practical form or even to protect them sufficiently to submit the drawings to manufacturers. There can be no doubt that if such a state of affairs could be brought about it would benefit the industry as a whole, as well as individuals.

I am sure this country does not lack ingenuity, particularly in things mechanical.

REDRUTE

London, S.E.12



Mr. R. Harley, of Alexandria, Egypt, who sends the above photograph, says his machine, which is a 1912 Scott, usually carries the load shown when conveying his family from the house to the bathing beach, a journey of several miles. The water-cooling of the engine is evidently a factor in this accomplishment

### LUMINOUS SPEEDOMETER DIALS.

Sir,—Seeing the letter by "X.Y.Z." in your most excellent paper, can any reader give me any experience with a luminous speedometer dial? I do dislike those little clip-on electric lamps. Surely if watches can be lighted by this method, it could equally well be applied to speedometers.

Nottingham. TRIARDO.

### WHERE IS IT?

Sir,—While reflecting during the winter months on the tour we had during the summer, we find that we cannot remember the name of a town, and this rather worries us.

There is a rather stiff straight hill in the centre of a town on the main road between either Hastings and Eastbourne or Eastbourne and Brighton. There is a gas lamp in the centre of the road at the summit of the hill, and a policeman stands some thirty yards from the bottom. There are shops up either side.

Can anybody enlighten us, and thus clear up one of the mysteries of our 1,147 miles tour? TOURIST.

Halifax.

### OBSTINATE VALVE CAPS.

Sir,—Mr. C. H. Wainwright's advice on this matter may be quite all right for some, but, personally, my pocket will not allow me to do as he suggests. I have had trouble of this nature before, and on employing the "spanner and gas pipe" stunt have only succeeded in shearing off the head of the valve cap. As he says, "something will go"; it does, but not the thing that is wanted to.

I, likewise, am looking for a preparation to overcome my difficulty, but in the meantime content myself by removing the valve caps pretty frequently, clearing the threads and smearing them with graphite. ZENITH-J.A.P.

Highgate, N.6.

Sir,—I think if "Ixion" used a 4 h.p. Blackburne engine, as I do, he would *not* have this trouble. Quite the contrary. It is, I find, a difficulty to get the caps on this engine to remain tight. Can any of your readers suggest a remedy? Perhaps many have the same difficulty. I have had to renew my caps twice during the last twelve months.

A. J. BREWIS.

### WHEN BORED WITH MAIN ROADS.

Sir,—I would like to call the attention of any of your readers, who may be bored with main roads, to three sporting climbs in the Chiltern area, perhaps unknown to them.

(1.) Starting from Chinnor (1in. Ordnance map, Sheet 106), about a mile towards Princes Risborough is a narrow lane on the right, which, beyond a level crossing, forks. The left-hand fork should be taken, and the track then bears to the right up Wain Hill. At the top the road is reached by the right-hand bend before a gate.

(2.) About two miles from Chinnor towards Watlington, in Crowell village, a lane goes sharp left over a level crossing to a white gash standing out in the hillside. This is Crowell Hill, and rather worse than the last!

(3.) As a third, take the Missenden Road from Wendover for a mile or so to a signpost to the left—"The Hale." Go straight along here until the road begins to rise rapidly, then turn sharp right and then sharp left. The main road is reached by bearing left through a gate at the top.

All these freaks are about half a mile long, have a gradient, in places, of about 1 in 4 or more, a surface of grass, loose chalk, and ruts, which are bad enough when dry, but are the very limit when wet, and are, without exception, thoroughly impossible for sidecar machines. They should, however, decidedly cheer any solo men in search of a little excitement. W. L. FINCHER.

Sir,—If any lover of freak ascents is beginning to find climbing too easy, I recommend to his attention a delightful quartette of hairpins near Buxton.

To get there take the road from Buxton to Bakewell. At the top of the mild ascent of Topley Pike a low wall on the outside of a right-hand corner overlooks a deep valley, up the far side of which a grass track may be seen ascending in zigzags. A rough road descends from the main highway a short distance further on down quite a respectable hill, ending in a loose and quite evil hairpin—this also can be seen from the main road above—to the bottom of the valley, where a river can only be crossed by a narrow foot bridge, which just passed the semi-T.T. bars on my 4¼ h.p. B.S.A.

Then, after proceeding to the right along the river bank for a short way, the climb begins in a steep pitch covered with loose stones leading up under a railway bridge to the first hairpin. No. 2 is worse, with an unprotected outside drop, and No. 3 worse than ever. I here had to "take the banking" for want of steering lock, but kept going. No. 4 is easier, but has a surface of rocky outcrop to discourage premature cheerfulness.

By Bartholomew the track eventually reaches a better road leading to Peak Forest Station.

I have climbed Alt-y-Bady, the Wrekin, and Litton Slack (only four miles away), but they are all easy by comparison.

Less dangerous and easier, but well worth visiting, is a good pair of hairpins at Grindon Halt, some ten miles east of Leek, on the Manifold Valley line, on the direct road between Grindon and Wetton villages.

G. E. MEADE.

### FLAKING OF MICA PLUGS.

Sir,—I read with interest in a recent issue a letter from Mr. H. de Lissa on mica plugs, and I should like to give my experiences with an 8 h.p. stationary engine (single-cylinder) and a 10 h.p. (four-cylinder) light car. With the former I found that no mica plug would run for more than one hour without chronic misfiring, but after replacing with a pre-war Bosch porcelain or an old Sphinx porcelain plug the engine would run consistently for hours. With the car engine, I found that misfiring at slow speeds—pronounced by various "experts" to be magneto trouble—was cured by replacing four new mica plugs with four Sphinx porcelain plugs. S. B. BASFORD.

### WHERE IS ENGLAND'S BEST SPEEDWAY?

Sir,—Referring to the possibility of a future T.T. race being contested over a course in this country, it would be interesting to learn what your readers consider to be the finest and speediest stretch of road of reasonable length between any two towns in the country.

So far as the south is concerned, I have not seen anything to equal the twenty-four miles from Royston to Newmarket on the Norwich road. As a rule, when touring, I do not expect or attempt to exceed an average of more than the legal limit, but recently on a Wooler, with luggage on the carrier, I easily did the distance in fifty minutes without ever opening to full throttle, although delayed for nearly five minutes at Six Mile Bottom level crossing. A good man on a fast machine could easily do it inside the half-hour. The surface is perfect, there are no corners, and not even a village on the road. Is there anything to equal this stretch in the North? What a T.T. course could be made of the triangle Royston-Godmanchester-Newmarket, if you could only get round the outside of Cambridge, or avoid it somehow. I congratulate the Cambridge C.C. on its roads. Other councils please copy. H. L. LEWIS

## Books & Maps for Motor Cyclists.

Issued in conjunction with *The Motor Cycle*.

**"MOTOR CYCLES AND HOW TO MANAGE THEM."**
The standard handbook on the motor cycle.
Price net, 2/6. By post 2/10

**"HINTS AND TIPS FOR MOTOR CYCLISTS."**
New Edition. Just Published. Price net, 2/- By post, 2/3.

**"TRACING MOTOR CYCLE TROUBLES."**
A system for tracing motor cycle faults and of remedying them when found. Fourth Edition.
Price net, 2/- By post 2/3.

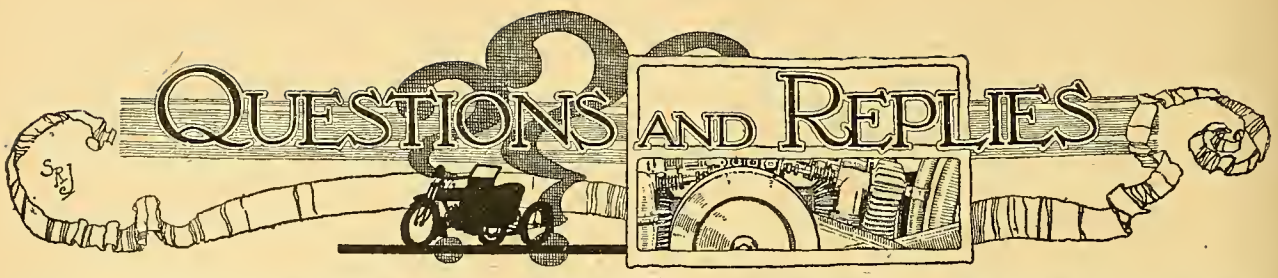
**"TWO-STROKE MOTOR CYCLES."**
A reliable treatise on Two-strokes, from the rider's point of view. Price net, 3/- By post, 3/3.

**"MOTOR CYCLE REMINISCENCES."**
By "Ixion," of *The Motor Cycle*.
Price net, 5 - By post, 5/3.

**"THE MOTOR CYCLE" ROAD MAPS.**
**Set of Three Maps—England and Wales, Scotland, London.** Set of three, complete in case. Price net, 5/6. Book post, 5/10. **Set of Two Maps—England and Wales, London.** Price net, 4/6. By post 4/8.

**"THE MOTOR CYCLE" ROUTE BOOK**
With 32 pages of Road Maps. Price net, 5/. By post, 5/4.

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., Dorset House, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the top left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

ROUTES.—By special arrangement with the Automobile Association and Motor Union, readers of "The Motor Cycle" desiring routes may enjoy the benefit of the Road Service Department of that organisation. Queries should be addressed to the Editor in the ordinary way (enclosing a 2d. stamp), and will be dealt with by the A.A. and M.U., who are regularly in receipt of reports from their representatives all over the country as to the existing state of the roads in any particular locality.

### USING AERO PLUGS.

I have some aero plugs, and I am told they are of no use to fit into a water-cooled car or air-cooled motor cycle. Why is this?—W.G.H.

The best way to find out whether the aero plugs in your possession are suitable for use in a car or motor cycle is to try them. In most cases we have found that they give fairly satisfactory results.

### ENGINE-SHAFT GEARING.

I have a 3½ h.p. Triumph (old model) fitted with a Mabon multiple disc clutch. Do you think if I have a Philipson pulley fitted it would take a light sidecar? Should I be able to start off all right, not having a kick-starter?—F.B.

As the Philipson pulley fits upon the engine-shaft, you will be unable to retain the Mabon clutch. The Philipson will certainly make the machine more suitable for light sidecar work, but there is no starting device incorporated, nor is it possible to use it as a free engine.

### WEAK MIXTURE.

What is the reason of blowing back of the carburetter (B. and B. with 43 size jet and taper needle)? It is most marked when starting. The machine is a 3½ h.p. P. and M. Can I use a smaller jet without the needle to effect improvement, and how can I obtain slow running when riding in traffic, as I am unable to do so now? There appears to be slight knocking with the engine when running in high gear. Would too much petrol from the carburetter to the engine cause that?—T.D.

Blowing back through the carburetter is usually caused by the mixture being too weak, and the slight knocking to which you refer also indicates weak mixture. You would probably get better results if you used a larger jet. Try No. .045. This will give you better starting and slow running; also set the taper needle so that it projects 1 1/16in. from the base of the throttle.

### A 750 C.C. V TWIN.

My machine is a 5 h.p. two-speed Rex (hub gear with hand start), 77.5×80 mm., date about 1913. (1.) What is correct valve timing for both valves, both valves for each cylinder being on one spindle? (2.) What angle should there be between the inlet cam and exhaust cam? (3.) What is the capacity of this engine? (4.) Wishing to do away with the hub gear, what make of other rear stays would fit, or who would supply me?—W.A.G.

(1.) Time the valves so that the exhaust just closes and the inlet just commences to open as the piston reaches top dead centre. (2.) This question cannot be answered in such simple terms as you desire, and may be disregarded if you time the valves as above. (3.) 750 c.c. (4.) In all probability it would be necessary to have new rear stays built up; we do not know of any that would fit without alteration.

## Important Dates.

**Fri., Jan. 27th, to Sat., Feb. 4th—Scottish Car and Motor Cycle Show.**

**Sat., Feb. 25th to Sunday, Mar. 5 h—Belgian Motor Cycle Show. Palais Degmont, Brussels.**

**Sun., Mar 5th—Argenteuil Hill-climb (France).**

**Mon., Mar. 6th—La Turbie Hill-climb (Nice).**

**Wed., Mar. 15th—A.C.U. One-day Trial for Stock Machines.**

**Thurs., Mar. 23rd—East Midland Centre A.C.U. Open Reliability Trial.**

**Sat., April 1st—Western Centre A.C.U.—Open Hill-climb.**

**Sat., April 8th—B.M.C.R.C., Members' Meeting at Brooklands.**

**Fri., April 14th, and Sat., April 15th—M.C.C. London-Land's End Run.**

**Sat., April 22nd—N.-Eastern Centre A.C.U. Open Reliability Trial.**

**Sat., April 29th—S. Midland Centre A.C.U Open Hill-climb.**

**Mon., May 1st, to Sat., May 6th—Scottish Six Days Reliability Trials**

**Sat., May 13th—Northern Centre A.C.U Open Reliability Trial**

**Sat., May 20th—S.-Western Centre A.C.U Open Reliability Trial.**

**Tues., May 30th—Junior Tourist Trophy Race**

**Thurs., June 1st—Senior Tourist Trophy Race.**

### MAKING TIMING WHEELS.

I think of converting an automatic inlet valve to mechanical operation, and should be greatly obliged if you could tell me if Bessemer steel is suitable for the timing wheels, etc.; if so, how are they case-hardened? I have tried case-hardening on several pieces, and they seem to go very brittle, and I fear the teeth would break off the wheels with the same process (I used potash). There is a brass plate on the crank case of the engine on which is the name Duffaux. Have you any recollection of it?—W.F.

The engine which you describe is apparently an old one of Swiss manufacture, and a forerunner of the present-day Moto-sacoche. The trouble you experience with the timing wheels is due to attempting to case-harden an unsuitable steel. Make them in mild steel, and harden with Kasenit, or similar hardening compound, following the instructions printed on the tin; case-hardening compounds may be obtained at any large ironmonger's or tool stores.

### MAGNETO FOR MOTO-REVE.

The magneto of a 2 h.p. (?) twin Moto-Rêve which I have is beyond repair, therefore I wish to fit a new one. The timing gear is rather confusing to me, as the wheels are eccentric. No doubt you know this little Swiss engine. What kind of magneto am I to purchase (as regards degrees)?—W.S.

The magneto which you need is one having equal firing angles, *i.e.*, 180°. The peculiarly arranged eccentric timing gear is used in order to compensate for the angularity between the cylinders, the magneto being alternately accelerated and decelerated, thus synchronising the timing point for both cylinders.

### PACING MACHINES.

On looking through some back numbers of *The Motor Cycle*, I saw an illustration of a 20 h.p. motor cycle used for cycle pacing on the track. Why are these machines always of such peculiar design and of such high power? You drew attention to the large pulley giving a ratio of 1¾ to 1. Why is such a high ratio needed for that work?—R.E.

The special requirements of a pacing machine are that it shall be capable of attaining fairly high speed, and at the same time shall offer the maximum amount of protection against wind resistance for the following cyclist. To render the latter possible, the driver of the pacing machine sits as far back as he can, almost directly over the back wheel, and he does not crouch down as would a racing motor cyclist. In consequence, the wind resistance to be overcome by the pacing machine is very great, and ample power is needed, hence the fitting of very large engines.

### HIGH OIL CONSUMPTION OF TWO-STROKE

If I run my two-stroke with petroil lubrication on the proportion of oil to petrol recommended by the makers (1 : 12), the engine dries up and overheats from this cause. If I oil from 1 : 10 to 1 : 8 the oil carbonises and sticks the top ring in its groove, harsh running and loss of power resulting. When hot from either of these causes, the engine develops, after about five to seven miles, according to gradient, a harsh grating noise, and will hardly climb any gradient. The magneto timing appears correct, as the engine functions well for the first few miles unless the piston ring is stuck. Mileage about 1,500 (in very short stages), and twice decarbonised. (1.) The top ring is a tight fit. Would it be advisable to rub it fairly loose, or would this result in the ring wearing the groove and more rattle? (2.) Would it be advisable to inject castor oil into the crank case occasionally? (I am running on a mineral oil normally, of course.)—NX 69.

(1.) It should not be necessary to use a greater proportion of oil than 1 : 12; it is just possible that an ignition fault or unsuitable sparking plug is a contributory cause of the trouble. An improvement would undoubtedly be effected by making the top ring a fairly loose fit in its groove. (2.) It is not advisable to mix the oil; stick to the one variety which you have been using. It is not advisable to inject oil in large quantities directly into the crank case of a two-stroke engine.

### BAD STARTING.

(1.) My machine is very refractory with regard to starting from cold. Injection of petrol has no effect. Can you suggest any cure? (2.) Should you think a different grade of oil would better things? The machine is a 5 h.p. 1920 Zenith, and I use benzole and B.B. oil. (3.) To my certain knowledge, the machine has run quite 2,000 miles, yet the running is still very good, although the engine has never been down. Should you think decarbonisation would improve the running? The machine certainly knocks slightly on top gear when accelerating on petrol.—G.C.W.W.

(1.) It is difficult to suggest why the engine will not start from cold if petrol injection has no effect. Starting difficulties, especially with twin-cylinder engines, are usually due to air leaks at the induction pipe joints or at the inlet valve guides. It is possible, however, that the trouble is caused by the contact breaker points having become worn, and, in consequence, they may have an excessive separation. The correct gap is $\frac{1}{64}$th. Also set the plug points to $\frac{1}{32}$in. (2.) Possibly a lighter grade of oil would be more suitable. (3.) The need for decarbonising should not cause the starting difficulty, and if the knocking on top gear is only very slight there is no actual need to take down the engine unless you require maximum efficiency.

### FOR A LEGLESS RIDER.

I am in search of a light runabout, three or four-wheeler, to suit a friend of mine who is unfortunate in having no use in his legs, and wonder if you, or any of your numerous readers, could put me in touch with one, or any one manufacturing such a car as will come up to my requirements. It must be a two-seater of ample power for Derbyshire hills, and entirely controlled by hand. Carburetter ignition and clutch controls on the steering wheel, change-speed lever and brakes by hand, and hand starter (preferably electric) from the seat. Also, I should like to know how the law would stand with regard to two independently operated brakes, both by hand, whether it is necessary to be able to apply both at once. If you could supply me with any information on the subject I will be greatly obliged.—LEGLESS.

There is no machine on the market which complies with your requirements, and, in consequence, you will have to convert some machine so that it is suitable for your particular use. In all probability, the Scott Sociable is the nearest approach to what you want, as it is a hand lever starter operated from the driving seat, and the only foot controls are the clutch and one brake, which could no doubt be readily converted to hand operation. Provided there are two independent brakes upon the machine, the law does not require that they shall be so arranged that both can be brought into action at the same time.

---

## READER'S REPLY.

### ACCUMULATOR CHARGING.

In your issue for the 5th inst. you reply to "W.J.H.," who wishes to charge a battery from 220 volts continuous current mains. It may be of interest to him to know that I have found it possible to do this satisfactorily, using a 100 ohm resistance mat (supplied for 2s. 2d. by F. W. Potter and Co., Phipp Street, Great Eastern Street, E.C.) in series with the battery. The mat should be fixed in a horizontal position, so that the ventilation may be as good as possible.—ARVON GLYNNE.

---

## EXPERIENCES WANTED.

*Readers' replies to questions published under this heading should be addressed c/o The Editor, "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4, when they will be forwarded direct to the querists concerned.*

"JAMES" (London, N.5.)—Wear of retreaded tyre on back wheel of sidecar outfit: Recommended retreading firms.

"POWERPLUS" (Consett).—Indian Powerplus, also Scout model: Spring forks, slow running, twist grip control, climbing, and general reliability (solo). Flexekas and Airtite sleeves on both models.

"C.D.W." (Walmer).—Ricardo piston for 4 h.p. Triumph (chain-cum-belt). Tuning hints for speed.

"S.W.L." (Croydon).—Dunelt with sidecar. Reliability, m.p.g. (oil and petrol), m.p.h., cooling, climbing, and general hints.

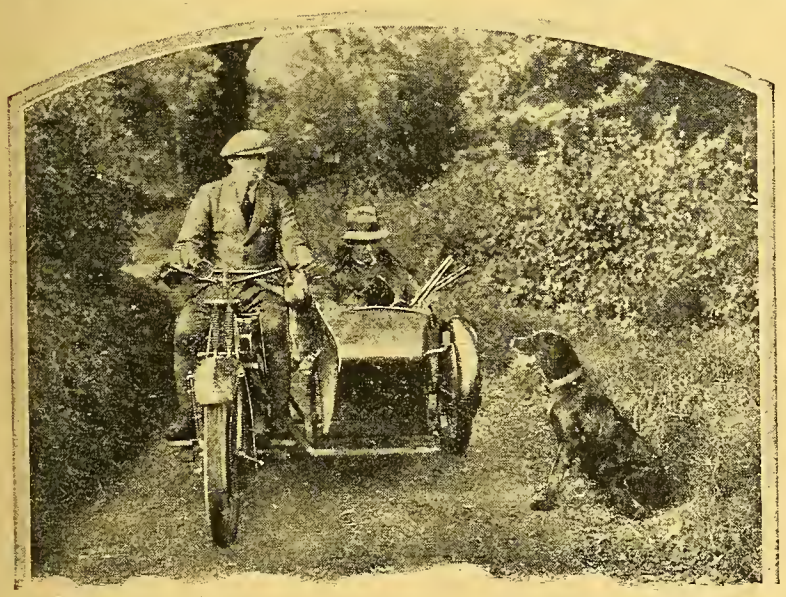
"A.F.T.L." (Bowdon). — $2\frac{3}{4}$ h.p. A.J.S., 1922 (standard sports): Economy, silence, and comfort.

"R.F.G." (Weymouth). — Coventry Premier three-wheeler: Economy, life of mechanism, brake efficiency, ease of steering and control, any disadvantages.

"E.C.B." (London, S.W.15).—5-6 h.p. Brough Superior (M.A.G. engine): Comfort, speed, and economy.

"W.A.M." (Coventry).—Binks carburetter, Flexekas air leak preventers, and Philipson pulley on 1913 single gear Triumph.

F.H.W. (Lee, S.E.13).—4 h.p. 1921 Blackburne, solo or sidecar: Reliability, consumption, and general hints.



One more of the series of "countryside" photographs which we have been publishing depicting the sidecar aiding sport with rod or gun. An Enfield outfit called into requisition to convey the guns and spaniel.

### A Removal.

The Birmingham Motor Accessories Co. have moved into larger premises at the old Quadrant Works, Sheepcote Street, Birmingham.

### A Hand Soap.

The address of the makers of the Horton liquid hand soap, upon which we commented favourably in a recent issue, is the Horton Manufacturing Co., Rickmansworth, Herts.

### Electric Hand Lamps.

An increase in the price of the Electro-Automate self-generating hand lamps was made in November last year, since when the cost has been 30s. for the type illustrated in our issue of December 22nd last.

### An American Lightweight.

Despite its heavy appearance due to the use of 3in. tyres, the Cleveland two-stroke weighs less than 200 lb. In our issue of December 8th last, the gross weight was given as 275 lb., this being the importers' figure, which included wooden case and packing for the machine.

### A Profit in Celluloid Ware.

Net profit of £18,557 for the year ending September 30th, 1921, is shown in the directors' ninth report of Bluemel Bros., Ltd., of Wolston, near Coventry. A dividend bringing up the total for the year to 15% on the ordinary shares is being paid.

### Tyres on Fire.

Recently a fire originated in the basement of the Shaftesbury Avenue premises of the Palmer Tyre, Ltd. It had obtained a good hold on tyre racks and tyres before it was discovered. The prompt use of chemical fire extinguishers by the housekeeper and his staff subdued the flames before the arrival of the fire brigade. The total damage is not serious, and will not affect the supply of tyres.

### American Machines in Italy.

Harley-Davidson motor bicycles were successful in winning no fewer than twenty-one of the leading events in Italy during the past season, among which may be mentioned the Circuit di Brescia, the Italian Tourist Trophy, in which Harley-Davidsons were first, third, fifth, sixth, and seventh; the Italian Grand Prix, in which they were first, second, and third; and the Aosta-Great St. Bernard hill-climb, in which they were first, fourth, and fifth.

### Correct Motor Cycle Lubrication.

A booklet on motor cycle lubrication, published by the Vacuum Oil Co., Ltd., Caxton House, Westminster, London, S.W.1, makes really interesting reading. It contains some lucid diagrams showing the path of the oil in the lubrication of various types of engines. Then follows a diagram of a gear box, with information concerning the lubrication of gears, while the book concludes with a lubrication chart showing the suitable grades of oil recommended for the leading makes of machines.

### Nortons in South Africa.

In the 600 c.c. solo class of the Rand M.C.C. annual speed championship, held on December 4th, near Johannesburg, over a distance of one mile from a standing start, the results were as follows: 1 (amateur), Dr. A. L. de Toit (3½ Norton); 2 (trade), Percy Flook (3½ Norton); 3 (amateur), C. A. Bulman (3½ Norton).

### A Scottish Machine.

A company has been formed to take over the manufacture of the Barr and Strond-engined Royal Scot motor cycle, described in *The Motor Cycle* of December 22nd, 1921. The trading name is Knightswood Motors, Ltd., with works situated at Strathcona Drive, Anniesland, Glasgow.

### Leather Coats.

One of our Manchester readers, Mr. E. R. Broughton, has written to us eulogistically about the quality and good value of a leather coat purchased from S. Lewis, 19a, Upper Charlton Street, Carburton Street, London, W.1. Incidentally, many readers wish to know how worn leather coats may be cleaned without damaging the colour. Advice on the point would be appreciated.

### Williamson Spare Parts.

A list of spare parts for the 8 h.p. Williamson has been issued by A. Moss, of 26, Moor Street, Earlsdon, Coventry. Mr. Moss, who was formerly works manager of the Williamson Motor Co., Ltd., undertakes the repair and overhaul of these machines.

### Carriage Paid.

New Imperial Cycles, Ltd., of Princip Street, Birmingham, have decided from now onwards to pay carriage by goods or passenger train on all their motor cycles sent to agents' depots in England, Scotland, Ireland, or Wales. If sent by goods train the machines will be packed in crates, and the crates will not be charged.

### In the London-Gloucester Trial.

In the official list of awards of the London-Gloucester-London trial, organised by the North-West London M.C.C., the name of H. S. Perrey (6 B.S.A.) was omitted. Since two other riders, B. L. Bird and J. S. Walker have reported that Perrey completed the trial satisfactorily, his case has been considered by the club, and he has been awarded a silver cup.

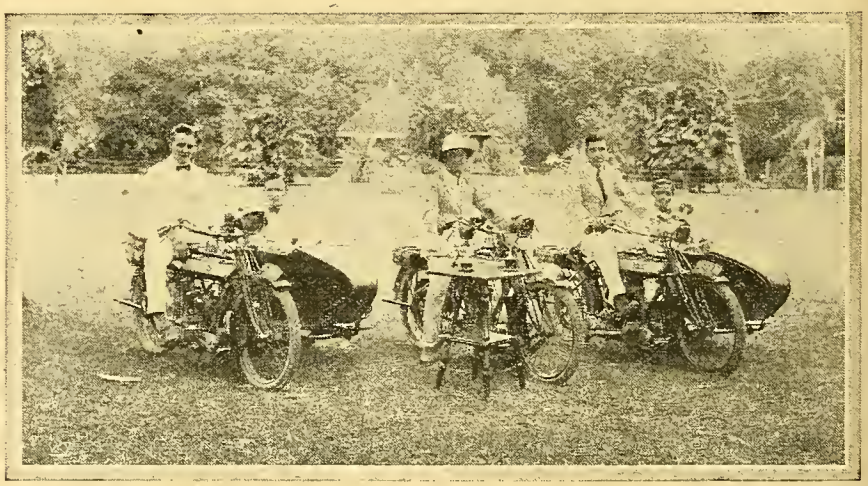
### Hard Riding on an Ultra-lightweight.

The J.E.S. miniature two-stroke which competed in the London-Gloucester-London reliability trial recently, and was standard in every respect, not only completed the course, but travelled 200 miles on the Wednesday and Thursday before the trial, was driven from Gloucester to London on the Friday previous to the trial, competed in the competition without any trouble, and was driven back to Gloucester on the following day. The whole journey occupied some 700 miles, and no mechanical difficulties of any sort were experienced. This is a remarkable performance taking into consideration the severity of part of the course, and the fact that the engine is only 169 c.c.

### Catalogues Received.

Barimar, Ltd., 10, Poland Street, London, W.1: "Straight Facts about Welding"—a folder published by this firm containing a few pertinent remarks by Mr. C. W. Brett.

Godiva Tool Co., George Street, Coventry: Tool-rolls, tool-kits, jacks, pumps, pliers, spanners, stocks and dies, etc., of interest specially to repairers, are listed in compact form.



MOTOR CYCLE CLUB LIFE IN CEYLON.

Three enthusiastic members of the Ceylon M.C.C., shown with the trophies won in reliability trials on their Ariel motor cycles

# GOVERNMENT SURPLUS STORES

**WE HAVE JUST SECURED A FURTHER CONTRACT WITH THE WAR OFFICE FOR ARMY CLOTHING. WE ARE NOW ABLE TO OFFER A VERY LARGE QUANTITY OF SURPLUS GOODS AT GREATLY REDUCED PRICES.**

500 NEW LEATHER COATS, TEDDY BEAR OR FLEECE-LINED. Double-breasted, with belt **£6 10s.** each

100 NEW OFFICERS' TRENCH COATS. Fleece-lined and oilskin interlined ..... **55/-** „

1,000 NEW WATERPROOF CYCLING LEGGINGS. Wool-lined. Sizes 1, 2, and 3. Fit up to 6ft. ..... **15/-** pair

250 NEW LEATHER HELMETS. Fur-lined .. **12/6** each

250 NEW LEATHER WAISTCOATS. (Without sleeves) ..... **21/-** „

150 NEW LEATHER WAISTCOATS. (With sleeves) ..... **45/-** „

125 BLACK LEATHER COATS. ¾ length. Suitable for motor cyclists. NEW ..... **75/-** „

500 NEW LEATHER JERKINS. Large sizes .. **8/6** „

5,000 PART WORN LEATHER JERKINS. (Repaired) ..... **5/-** „

500 SHEEPSKIN-LINED COATS. Suitable for drivers of motor transport, etc. Long and in good condition ..... **10/-** „

3,000 GROUND-SHEET CAPES. Part worn. Condition good. Worn as Ground-sheet or Ground-sheet Capes ..... **2/6** „

1,000 NEW GROUND-SHEET CAPES ..... **3/6** „

1,000 PAIRS NEW RUBBER THIGH BOOTS, best U.S.A. makes. Sizes from 8 to 12 ..... **15/-** pair

1,000 PAIRS NEW RUBBER KNEE BOOTS. U.S.A. best quality. Sizes 8 to 13 only ..... **12/6** „

1,000 SHEEPSKIN-LINED THIGH BOOTS. Suitable for motor cyclists ..... **12/6** „

1,000 PAIRS NEW BROWN AND BLACK OFFICERS' BOOTS. Medium weight. Guaranteed solid leather. Finest boots ever produced on the market. With toecap or without. Sizes 6 to 11. Suitable for shooting and good hard wear ..... **27/6** pair

500 PAIRS WILLOW CALF GRAIN TRENCH BOOTS. Lace to knee, with buckle ..... **37/6** „

2,000 KILTS, TARTAN, "BLACK WATCH." 7 yds. cloth for making up. All wool. Part worn. Condition good ..... **8/6** each

1,000 SIDCOT SUITS, NEW. Wallaby collar, imitation. Rubber under-lined. To clear at the greatly reduced price of ..... **35/-** „
Sizes 5ft. 6in., 5ft. 8in., 5ft. 10in.

WE HAVE ALSO A VERY SPECIAL LINE OF ALL-WOOL REAL WITNEY BLANKETS. WHITE. 70×90in. Weighs 8¾ lb. ..... **27/6** pair

1,000 PAIRS REAL ARMY BREECHES. Leather strappings. NEW. 5ft. 3in., 5ft. 5in., 5ft. 7in., and 6ft. ..... **15/-** „

1,000 BEDFORD CORD BREECHES. NEW. Leather strappings or self strappings. All sizes up to 44in. and 46in. in waist ..... **30/-** „

250 PAIRS KHAKI SERGE TROUSERS. NEW. All sizes up to 6ft. ..... **12/6** „

5,000 NEW BLUE DUNGAREE AMERICAN BIB AND BRACE OVERALLS. Sizes 34in., 36in., 38in. ..... **4/6** „

5,000 GROUND-SHEETS. 6×3ft. Part worn. Condition good. Nearly new ..... **2/6** each

1,000 PAIRS NEW BLACK OILSKIN LEGGINGS **2/-** pair

100 GOVERNMENT JEAN BOILER SUITS. Sizes 32in. to 46in. ..... **12/11** each

**WE HAVE ALSO A LARGE NUMBER OF OTHER LINES TOO NUMEROUS TO MENTION. BUT PLEASE MAKE ENQUIRIES.**

PHILIPSON'S

PATENT AUTOMATIC GOVERNOR

PULLEY

AND GEAR COMBINED.

Philipson's Latest!

GOVERNOR PULLEY AND VARIABLE GEAR COMBINED WITH FLY WHEEL for all two-stroke engines.

The Lightest, Speediest, and Simplest Gear on the market for direct belt-driven 2-stroke and 4-stroke engines.

ONLY adds 2 lb. (approx.) to the weight of a 2-stroke machine, and 6 lb. (approx.) to the weight of a 4-stroke machine.

During the past week we have fitted the following machines:

| 2-stroke. | 4-stroke. |
|---|---|
| LEVIS, | TRIUMPH, |
| O.K., | NORTON, |
| CALTHORPE, | ROVER, |
| VILLIERS, | SINGER, |
| etc. | COULSON-BLACKBURNE |

We are now in a position to supply the Philipson Pulley to fit J.A.P. engines without any alteration to the machine or "staggering" of the engine.

Our Flywheel Governor converts a single-speed 2-stroke into a speed model —*the lightest speed model on the market!*

THE ONLY GEAR WITH NO END THRUST.

IMMEDIATE DELIVERY.

*Send for Illustrated Booklet.*

No gear box friction.
No grinding noises.
No wheels or pinions to chew up.

*What is your make? Write us*

REDUCED PRICE £7 7 0 Carriage Paid.

# From GADGET to High powered COMBINATION

With better roads being made, lower prices of complete machines, accessories and supplies, and prospects of still further reductions, 1922 promises to be a bumper season for the motor cyclist. It will be a season of fuller enjoyment with greater economy, certainly the latter if you make a point of buying only standard and well-known goods. This is where our service will help you; we can supply you with everything you are likely to want, over the counter or promptly through the post (carriage is paid on orders over £1) and you know that whatever it is, it is the best your money can buy—and more important—the *most* your money can buy.

## SPARES AND TYRES

We can deliver ex stock any spare for all well-known machines, engines, gear boxes, as well as parts for Powell & Hanmer Lamps and Generators, whilst our tyre stock is large and comprehensive. Owing to arrangements with the manufacturers of Hutchinson & Michelin, all covers despatched are guaranteed *not* to have been in stock *more* than three months.

## MOSS GEAR BOXES

We are sole London fitting agents for these and other Moss Components. If you have a lightweight with a 2-speed box—no matter what make—let us fit the efficient Moss 3-speed Gear box to it—self-contained gate change clutch and kick starter. Your present 2-speed box will be taken in part payment. Balance deferred or cash. Fitted free at our workshops.

## WHERE YOU GAIN

Come to THE SERVICE CO.—no matter what you want. You'll get the lowest price and the best service,—from a staff of keen practical motorists, who know exactly what you want, and have unique facilities to ensure your entire satisfaction.

*ASK FOR OUR NEW 1922 CATALOGUE WRITE OR CALL FOR IT TO-DAY.*

*Insurance Policy*

# Testimony

THIS space will be occupied each week with copies of letters from Policy holders who have made claims. Original letters may be inspected.

*Gentlemen,*

*I beg to inform you that I have taken over my A.J.S. Combination, which looks little the worse for its adventure.*

*I must take this opportunity of saying that I am in every way more than satisfied with the manner in which you dealt with my claim, and can now quite understand how you are able to publish a fresh testimonial every week.*

*I am, Yours faithfully,*

***The only Safe Test of Insurance is Claims. We settle Claims promptly.***

¶ ¶ In purchasing a motor cycle you may be getting much or little for your money You may be getting a maximum of pleasure and service—or, on the other hand, you may have less of either than you have a right to expect. ¶ We wish to emphasise that such disappointment is readily avoidable. It is entirely a matter of a wise choice—of the machine itself, and the people from whom you buy it. Therefore, your first need is expert, impartial advice. ¶ This we gladly and freely offer you, leaving the question of placing the order afterwards for you to decide. You will be under no obligation to us, and we shall not worry you. ¶ At the same time, if we can have the pleasure of adding YOUR name to the thousands of those who have found by experience that we can serve them rather better than most people in the motor cycle and light car business we shall be more than glad

*1922 MODELS FOR EARLIEST DELIVERY include:*

**ARIEL, BROUGH SUPERIOR B.S.A., DIAMOND, DOUGLAS, EDMUND, ENFIELD, HUMBER, INDIAN, MASSEY-ARRAN, MATCHLESS, NORTON, RUDGE, SCOTT, SUNBEAM, TRIUMPH, and VELOCETTE Motor Cycles;**

**BELSIZE, BRADSHAW, CROUCH, ROVER, and WOLSELEY Light Cars.**

*Cash, Exchange, or any reasonable Deferred Terms.*

¶ Always an exceptional stock of used machines, at most attractive prices—sold with our guarantee.

# Beat 'em All

in the AUSTRALIAN SIX DAYS TRIAL—and the only machine to go through the most strenuous gruelling under wretched weather and real colonial conditions without losing a point, and declared the absolute winner.

## 3½ h.p. SPORTS DOUGLAS

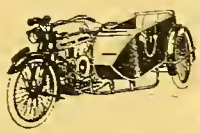
the bike that does 80 m.p.h.

I have only one demonstration model fully guaranteed and equipped with lamps, etc.

**£110** to first cheque.

## A VERY SPECIAL OFFER!

1922 Model. Fully insured. Fire, theft, third party, and all accidents, equipped with lamps, horn, licence holder, large coppered exhaust pipes, 2¾ h.p. 2-speed Douglas, not ridden 50 miles. Fully guaranteed. Taken in part exchange. **£75.** Free delivery.



## 4 h.p. DOUGLAS AND SIDECAR

Screen, leg shields, electric lighting, late 1921. A real bargain. Most elaborately fitted up and equipped. Price **£110.** Licence paid.

## ZOOM! ZOOM!!

The wonderful and most popular exhaust system for 2¾ h.p. Douglas. Beautifully made of heavy burnished coppered tubing of 2in. diameter. It gives a lovely "Zoom," inoffensive to the ear, yet it is entirely free from back pressure. Adds £10 to the value of any Douglas, yet only costs **30/-**, whilst a standard silencer costs **37 6.** Six months ago the labour alone on ZOOM! ZOOM!! would have been more than this. Burnished nickel-plated finish, **3/6** extra.

## HAVE YOU SEEN

my patent twin rings? They give more power, greater compression, longer life, better acceleration, and save oil; and yet cost the same. Do not have your engine overhauled without fitting these rings. I have many remarkable testimonials about them. "They are simply wonderful." 2¾ h.p. size, **1/6** each. 4 h.p. size, **1/8.**

**A.C.U.** Official Repairer. Any repair finished in one week. Any spare part by return of post.

**E.I.C.** Magneto Service Depot for West of England. All spare parts for any model by return.

*W. G. Coram*

*Official Douglas Agent,*

**140, Victoria Street, BRISTOL**

*Telephone: Bristol 3792.*

# SO EASY TO FIT!

You can equip your machine with a

# 'WATTALITE'

LIGHTING AND GENERATING SET

Just as easily as you can fit a speedometer.

¶ It has the same flexible shaft drive direct from the wheel. It can, therefore, be quickly and easily adapted to *any* machine. ¶ This is only one of many advantages which the "Wattalite" possesses.

Trade enquiries invited.

Two of our many unsolicited testimonials received.

Melksham, Oct. 20th, 1921.

"I duly received my Cylinder, which you despatched in answer to my 'phone message. I have assembled same, and put it through a good test during the last week-end. I am pleased to inform you it is at least 25% better than before. I thank you for the care taken and the promptness with which you executed the order."—T.S.

Ruabon, Oct. 20, 1921.

"I have received new Piston, etc. I am quite pleased with the job. Thanking you for the prompt attention and good work"—R.M.R.

# Leave it to the "Best"

WHY not forget all about your lubrication and leave it to the

# BEST AUTOMATIC OIL PUMP

*Less Oil-Better Running*

One user says—"It is the cheapest and most useful accessory I have purchased in 15 years of motor cycling."

It costs only 25/6—plus cost of fitting. It cuts down oil bill 30% to 50% and provides perfect lubrication with its attendant advantages.

## PARTS AND ACCESSORIES.

COPPER Exhaust Pipe (solid copper tubing), polished, all sizes stocked; straight, from 2/3 foot. Bending a speciality.—Evans.

TRIUMPH Pipes, special offer, complete with clip; long copper 14/6, steel 13/-, plated 18/-.—Evans.

DOUGLAS, 2¾h.p.; copper 12/6 pair, steel 10/-. —Evans.

RUDGE, Sunbeam, Rover, Norton, copper 20/-, steel 16/-; New Imperial, Omega, Levis, etc., copper 14/-, steel 10/6; all T.T. bends.—Evans.

MUFFLER Ends (Norton pattern), detachable, fish-tailed, various sizes stocked, from 2/6.—Evans.

FOOTBOARDS, solid aluminium, upcurved front and heel piece, with adjustable clips, 15/- pair; with fittings for Douglas, 15/-; for Triumph, 16/-.—Evans.

TOOL Boxes, armoured, suit Triumph, etc., 10/9 pair; with locks, 13/- pair.—Evans.

HANDLE-BARS, plated, Triumph pattern, W.D. or D.R., ⅞in. 14/-, 1in. 15/-.—Evans.

LEGSHIELDS, suit all machines, enamelled and gold lined, complete 13/6 pair; aluminium, 15/- pair. —Evans.

WHEELS from 42/- pair; to suit standard Triumph, rear 60/-, front 30/- complete; specials built to order; any parts supplied.—Evans.

BELT Rims.—Standard Triumph 10/6; any size to order 16/6; tyre rims, 10/6; spring forks from 50/-.—Evans

CARRIAGE Free, cash with order, discount to trade. —Evans Bros., Brougham St., Heckley, Birmingham. [X5280

P. and M. Engines, £6; gears, £2/15; frames, £1/10; mudguards, 12/-; carriers, 14/-; set 40 spokes and nipples, 6/-, new.—Below.

P. and M. Lubricators, 17/-; tank caps, 1/9 each; valve caps, 3/6; footrest rubbers, 2/- pair; brake pedals, 4/-; magneto chain covers, 4/6; handle-bars, 10/-.—Below.

P. and M. Chains, set of 3 £1/5; chain cases, good, £1/5 set, spring forks complete, £2/10 set, magneto with sprocket and chain, £2/5; carburetter, £1/15; toolbags, 5/6; sidecar mudguards, 10/-.—Below.

P. and M. 43-tooth Rear Sprockets, 12/6; legshields with fittings, 15/-; silencers with rear pipe similar to 1921 model, 17/-.—Below.

SILENCERS.—Harley-Davidson, with rear extension pipe, 17/6; cast aluminium silencers for large twin, 17/-; single, 15/-; 2-stroke and lightweight, 10/6; all rear pipes fitted.—Below.

CHAINS.—P. and M., set of 3, £1/5; Douglas 2¾h.p., 4/6; 4h.p., 5/6; Triumph, 5/6; others 2/- ft., good condition.—Below.

SADDLES.—P. and M., Douglas, Triumph, etc., 17/6. re-covered, good.—Below.

ACCUMULATORS, 4 volt 20 amps., new, in case, 14/-; 6 volt, £1.—Below.

DOUGLAS 2¾h.p. Frames, complete with front forks, £3/15; gear boxes, £4; cylinders, 10/-; wheels, rear £1/5, front £1; carburetters, £1/5; silencers, 12/6; handle-bars, 10/6.—Below.

CARBURETTERS.—Amac, B.B., Senspray, £1/10; Douglas, £1/5.—Below.

LEVERS.—Magneto, 4/-; carburetter, 5/6; clutch and brake, 5/6.—Below.

ELECTRIC Lighting Set, has 4 volt accumulator, new in case, 5in. aluminium head light, aluminium tail light, and wires, £1/15, complete. All cheques and M.O.'s should be crossed.—Motor Cycle Accessory Co., 868a, Old Kent Rd., London, S.E. [5295

85×70mm. Pistons, for J.A.P. engines, 9/- each.—Automotive Spares, Ltd., 178, King's Rd., Chelsea, S.W.3. Tel.: Kensington 255. [3851

GENUINE Douglas Patent Leather Mudshields with attachments, noiseless; 5/-; postage 1/-.—Baskerville, School Rd., Hale, Cheshire. [4930

ARIEL Engine and Frame, with De Dion engine complete, new mag. and bearings, drop frame; bargain, £20.—Gibbs, High St., Burnham, Bucks. [4613

BINKS, 1921, 1¼, perfect, spare jets, 57/6; A.O. dynamo, off Douglas, 22/6; Austin pillion seat, 8/6; Tan-Sad, £1.—25, East St., Taunton. [4664

BINKS Carburetter (1921) fits 2¾h.p Douglas, perfect, 55/-; 8 spare jets and tuning instructions.—Jennings, 100, High St., Tooting, S.W. [4909

FLEXIBLE Hot Air and Exhaust Tube; bend by hand, no heat required; list.—Ribbans, 6, Scotland Green Rd., Tonders End, Middlesex. [4541

CROWN Adjustable Pulleys: Triumphs, Humbers, Bradburys, Premiers, B.S.A.'s, Precisions, 17/6; J.A.P.s, 19/6; Douglases, 25/-.—Ridington.

MAGNETO Sprockets, 7-tooth to 24-tooth; engine, chain, and hub sprocket manufacturers.—Ridington.

LIGHTER Flints, 10d. doz., 3 doz. 1/9, 5/- gross. —Ridington, 202-4, Southampton St., Camberwell. [3311

## PARTS AND ACCESSORIES.

SPEEDOMETERS complete from 45/-, guaranteed; repairs executed.—J. W. Robins, Speedometer Specialist, 97, Latchmere Rd., Battersea. [3147

DASHBOARD Lamps, with bulbs and 2 yards flex. 1 sample carriage paid 1/6, 12 carriage paid 10/6, and 100 carriage paid 80/-.—Below.

ANGLE Valves to fit standing part of any standard sized M.B. or car valves, 2 carriage paid 2/- or 100 75/-.—Below.

STEERING Wheels, 12in. central bore, ¾in. aeroplane type, 3/- delivered, lots of 6 delivered 15/-.—Below.

WASHERS, engineer's bright steel, sample set 6d., one gross (mixed) 2/-, 10 lb. 11/6, carriage paid. Size of bore and weight per gross, i.e.:

1/8 IN.=2 oz., 3-16in.=3 oz., 7-32in.= 6 oz., ¼in.=7 oz.

5/16 IN.=15 oz., ⅜in.=22 oz., 7-16in.=26½ oz., ½in.=2 lb.

LOTS of 28 lb. at 20/-, 112 lb. lots at 60/-, rail forward.

N.B.—The same washers plated, 25% extra.

TERMS Nett Cash. Satisfaction or cash returned if requested within 21 days.

VALE Engineering Syndicate, 8-11, Brown's Buildings, St. Mary Axe, E.C.3. Tel.: Central 877. [0699

150 SCREWS, nuts, washers, set screws, 3/-; 144 bright steel bolts, 2/6; 72 bright hexagon nuts, 2/6.—See below.

72 BEST Spring Washers, 3-16in. to ½in., 1/9; 36 castle nuts, ¼in. to ½in., 1/9.—See below.

144 Coppered Bifurcated Rivets, 8d.; 12 8in. hacksaw blades, 1/6; any of the above carriage paid.—Wood, Tithebarn St., Preston. [X4769

GEAR Box, Sturmey 3-speed, clutch, kick starter, 1921, slightly used, guaranteed perfect; £14.—James, '46, Chaucer Rd., London, S.E.24. [X5247

ARIEL Twin Engine, 8h.p., Senspray, Bosch, frame, handle-bars, Druid forks, tank, 2 wheels; offers any part?—512, Lordship Lane, Dulwich, S.E. [4725

SPRING Frame, P.V., enamel and plating excellent, complete less engine; £12/10; particulars, stamp.—F. Crapper, 74, Albert Terrace Rd., Sheffield. [4710

P. and M. Mudguards, pair 25/-; tank, 15/-; frame, 35/-; timing covers, 20/-; inverted levers, 9/-; new front brakes, 27/6; stands, 12/6.—Below.

P. and M. Exhaust Cap and compression tap for priming, 5/-; complete inlet caps, 3/6.—Specialist, 147, Burlington St., Liverpool. [4383

P. and M. Gears, £3; engines and tool bags, 4/6; handle-bars, 7/6; tail pieces, 5/6; mudguards, 17/-; hacks, 7/6. I have every part P. and M.

P. and M. Sidecar Chassis, stoved, enamelled, plated fittings, £4/10; approval against cash.—Welding Co., 55, St. James Rd., Bermondsey. [5277

TYRES.—Wood-Milne special, regular stock, 26×2¼ and 26×2½, 13/6; tubes, endless, 26×2¼ 6/-, 26×2½ 6/9, 28×3 5/6. All above post free.—Below.

OILSKIN Combination Suits, Pegamoid brand, will not stick, new, surplus Government, complete with sou'-wester; 16/6, post 1/-.—Below.

AIRMEN'S Leather Flying Coats, ideal for motor cycling; 65/-, post free; state height when ordering.—Below.

PLUGS, W.D.—Lodge, K.L.G., and A.C. Titan; 1/9; all brand new, in makers' boxes; postage, one 4d., two 6d., twelve 1/3.—Below.

ELECTRIC Torches, new, as issued to officers, 11½in. long, nickel-plated fittings, hull's-eye lens; 3/9 complete, usual price 14/6, postage 9d.—Below.

WATCHES aeroplane 8-day, fully jewelled and compensated, £2, originally cost £8, post free; aluminium dashboard holders for above, 3/6, post free.—Below.

FOUNTAIN Pens, self-filling, lever type, screwed cap, 14-carat gold nib; 5/-, post free, wonderful value.—Below.

ALL above goods sent on receipt of cash; money returned in full if not approved.—The Woodside Motor Co., 4, Station Buildings, Wondside, S.E.25. [5033

LONG Exhaust Pipes, direct from engine, in copper or nickel-plated steel, for all make of machines; standard sets, with detachable muffles, from 21/-.—Below.

DISCS, in polished aluminium or light steel, from 15/- per wheel; leg shields, in polished aluminium or light steel, from 17/6 per wheel.—Mersey Disc Co., 34, Sutton St., Warrington. [1165

MAGNETO, off Rudge, £2; carburetter, Brown and Barlow, pilot jet, 25/-; Brown 3½h.p. engine, mechanical valves, 35/-.—Burdett, Cycle Depot, Market Harborough. [X5281

MORGAN.—Owners write for illustrated list describing the Hall "5 second jack." Designed for the Morgan. Quick, simple, efficient.—S. Hall, 91, St. Peter's St., St. Albans. [4617

## The Sidecar and the Small Car.

SPEAKING recently at a gathering where he was the guest of honour of keen motor cyclists, a prominent member of the motor car industry astonished his hosts by expressing the opinion that the sidecar is doomed. Everyone is, of course, entitled to his opinion, but there are times when its expression may be out of place, especially when it suggests exploitation of personal interests. The speaker in question, after stating that he could not imagine anyone riding in a sidecar if he could command a car, and suggesting that the time was near at hand when a small car would take the place of the sidecar outfit, made no secret of the fact that he was interested in a projected cheap small car.

Undoubtedly there is a big market for cheap and light four-wheelers, but those who would revolutionise economical motoring have a long way to go before it can be said that the end of the sidecar is in sight. Certain it is, very cheap cars will not appeal to those who hitherto have purchased the most elaborate type of sidecar, for such motor cyclists are in a class by themselves and may only be compared with those in the automobile world who buy the most elaborate car. If ever low-priced four-wheelers rob the motor cycle world of its purchasers, then their price and performance must approximate to those of certain sidecars which are sold on price.

The pride of possession factor is invariably overlooked by those who predict the doom of the sidecar, perhaps for the reason that it does not play the same part in the purchase of a car as is the case where a motor cycle is concerned. There are very few sidecars on the road to-day which are not owned by keen enthusiasts. On the other hand, a very large number of car owners are interested only in the ability of their vehicles to carry them from one place to another, ignoring the general efficiency of the machine.

Those who forecast the end of the sidecar are usually those who have had little experience with sidecars and regard them as uncomfortable and unmechanical machines tolerated by their owners only for want of a four-wheeler within range of their purses. Motor cyclists know this view to be erroneous. Nevertheless, the statements to which we have referred are not calculated to help the motor cycle industry, because the speaker was a public figure of sufficient importance for his remarks to be quoted *extenso* in the lay Press and read by many who may be tempted to defer purchasing a sidecar until the mystery vehicle appears.

## F.I.C.M. Weight Limits.

WE have several times urged that the various F.I.C.M. regulations—especially those referring to weight limits—be revised. Under the present arrangement motor cycles competing in such events as the Tourist Trophy Races and the A.C.U. Trials have to conform to these regulations, which include absurd weight limits. That weight limits may be necessary is agreed, but to impose *minimum* weights which exceed those of motor cycles sold to the public is futile, and it is not uncommon for machines to carry weight to bring them up to the F.I.C.M. limits.

A minimum weight limit may have been necessary on the Continent at a time when 1,000 c.c. machines weighed less than present-day 250 c.c. lightweights, but, in view of latter-day knowledge of metals, manufacturers are not likely to jeopardise their chances of success by building extremely light machines which are unsafe.

If there is a reasonable argument why a minimum weight limit is to be retained, then the same argument should apply to cycle cars, which, for international competitions, have to conform to a definition which includes a *maximum* weight limit.

An index to the advertisements in this issue will be found on the page facing the back cover.

## Club Propaganda.

THE Cardiff M.C.C. are propaganda experts, and amuse themselves during the winter by trying to attract new members. They issue a ragtime broadsheet which is published in the local papers, and is interesting because it does not contain one solitary morsel of fact; it is pure leg-pulling from start to finish, and is written to show outsiders what sort of company they may expect if they join up. Thus:

Lectures.—"Landmarks within 100 Miles." (Many little-known inns are shown off the beaten course where nourishment may be obtained at all hours. A list of Sunday openers is given gratis, with quickest routes thereto, and a list of passwords.)

Exchanges.—An allotment and a washstand for a Morgan or other cycle car.

A euphonium, five rose trees, and dress suit for good sidecar outfit.

1,000,003 Russian roubles and 500 local shipping shares for good lightweight.

He goat, harmonium, and case of stuffed birds for a small four-seater.

I must really go and lecture to this club on the velocity, composition, and consumption of mixture.

## Running a One-day Trial.

SOME weeks ago I appealed to the clubs to advertise their trials in the villages along the routes, as the locals love watching our struggles, and will be of great help as route marshals if they are informed of the date and hour. An official of that very live body, the Sheffield and Hallamshire Club, sends me a copy of the instructions issued to the staff for a one-day trial held in the summer, from which I see that plenty of advertisement was done along the route. With a shudder I cull the following paragraph:

"If the river is dry on Friday, get it dammed to one foot deep."

I call this simply pusillanimous for a Yorkshire club. Why not three feet?

## My New Role.

AFTER road trouble one day (broken crankshaft, I think), I dived into a train in motion, and, to my joy espied a magazine left on the seat by some departed passenger. My hopes of mental refreshment during an irksome non-stop were rebuffed when I found the journal was *Blue Bells* (or words to that effect) and its principal contributor a certain "Aunt Rosie," who advised fair readers what immediate action to apply if they spotted Bertie taking another maiden to the cinema. To-day I find myself compelled to play a similar rôle. The flapper who flaps on the bracket of a reader signing himself "Big Four" is tired of her parrot perch, and yearns for a 'bus of her own. "Big Four" promptly procured a sheaf of folders describing the best baby two-stroke. Not a bit of it. Miranda insists on a sports model of not less than 500 c.c. This time "Big Four" has come to the right man. I have *often* been there. There are two modes of action, the *suaviter in modo* (otherwise, the velvet glove) and the *fortiter in re* (otherwise, the iron hand). The iron hand policy consists simply and solely of getting another flapper. "Big Four" informs me in a lugubrious postscript that he has thought of this only to reject it (he has my sympathy, whether he is alluding to compromising letters, or to the fact that, like Little Willie in front of Verdun, he is too deeply engaged to withdraw). The velvet glove (cheer up, "Big Four"!) consists of borrowing . . . well, this almost needs a paragraph to itself.

## The Velvet Glove.

LET "Big Four" procure an extremely large 'bus—998 c.c., if possible. Let him carefully detune it so far as to make starting difficult. A wide plug gap. Air leaks at every joint in the induction pipe. No. 3 spirit in the tank. Seccotine in the oil tank. Let him then select a day on which the temperature is low and the sky overcast. Let the road then be taken. "Big Four" will start the lady's 'bus at the outset (a surreptitious injection of methyl ether is recommended). The lady must then be tempted to a scrap, and allowed to get the better of it. Within a mile or so "Big Four" must allow himself to be left, whereupon he will lay bare his rear tube, unscrew and remove the tyre valve therefrom. This will give him a strafe-proof excuse to push home. The lady will be left wrestling with the unstartable 7-9 h.p., scaling some 3 cwt. When she finally returns, she will be in an extremely chastened condition, and it will be found that, for the future, she prefers a Levis Popular to anything on wheels.

Personally, I do not commend such mean-spirited handling of a restive damosel. I believe in beginning as you mean to go on—in getting the girl properly to heel right at the outset. But as "Big Four" is clearly only about 0.35 of a man, he may prefer the latter of my two alternatives.

## Secret Switches.

ISN'T it courting trouble to fit motor cycles with any gadget which shrieks aloud "I am a switch"?

Not the least convenience of motor cycles, as compared with other motor vehicles, is that the bicycle occupies so little room that one can leave it anywhere. But if the top tube boasts a polished aluminium or mahogany instrument board adorned

**Occasional Comments.—**

with two or three tumbler switches, every urchin who comes along is sure to light the lamps and blow the horn; and if the machine is stored in a public garage, few mechanics can be trusted to refrain from utilising its lamps on occasion. It is quite easy to devise secret switches for both lamps and hooter; a rotatable lamp fitting will serve to turn on the light (Hunt's have already applied this dodge), and a twist-grip would make an admirable hooter switch. Of course, such ideas may get known even to the street arab in the course of time, but at the worst they would be a partial safeguard. Nothing is more demoralising than to sit down to a good lunch in a road house, and halfway through the soup to hear a continuous ear-piercing screech from one's hooter, when the battery is known to be rather on the low side. Failing secret switches, a removable plug such as figured on ancient ignition systems would be better than nothing.

### Diagnosed!

IN the old days when we depended on accumulators for ignition purposes, we all carried voltmeters or testing lamps. To-day, few of us own such gadgets, and electrical tests are correspondingly difficult. The other day, my accumulator lighting set chipped out miles from anywhere. Pitch darkness. No help available or to be expected. An unknown road. A fair, but futile, companion. I began to feel much as Ludendorff felt in October, 1918. (Electrical engineers should not read the following confession.) My accumulator was carried astern, and two wires ran forward from it to a switchboard. A limited supply of matches and sensitive fingers were my sole resources. I traced the battery wires to the switchboard, struck a match, seized a pocket knife, and used it to make two or three rapid "shorts" between the terminals of the battery wires. No spark. Then I hied me to the tail of the machine, and made a similar ruthless experiment across the terminals of the battery itself. No spark. Then I struck another match and closely inspected the permanent bridge between the two cells. One of its piers was cracked clean across. Felt in my pocket. Unearthed a piece of stout string. Lashed that fractured bridge hard down on its pier. Switched on. Brilliant light. Home rejoicing.

### Puzzling.

THE other day my new engine developed an intensive fit of the sulks. It had never been a good one, and at last I reluctantly took it down miles before treatment should have been necessary. The piston rings of both pistons were jammed in their grooves with the gaps closed right up. There was no carbon or dirt of any sort in the grooves or on the rings, and the inference was that the rings had originally been fitted so tight that they had never opened when the pistons were inserted into the cylinders. If the fit was originally correct, the cast iron pistons must have "grown." Funny, wasn't it, but pistons do grow, you know.

THE TOUCH OF WINTER.

A snapshot taken in "leafy" Warwickshire after the blizzard last week. Beautiful as was the effect, the thick snow was not appreciated by the motor cyclist who has to travel day by day and in all weathers.

# Famous Scottish Hills

THE INVERFARIGAIG CORKSCREW

## A Commentary on the best-known Hills in the Highlands

THE organisers of the Scottish Trials are singularly fortunate in that they can leave out plenty of the worst hills which they know, and yet confront their entry with a couple of climbs daily for a week, any one of which is perfectly capable of spoiling a clean sheet for a good rider. This is true if the weather chances to be fine; when the weather is atrocious the hills are naturally still more "chancy."

Pride of place goes unquestionably to the Pass of the Cattle, the five miles up and five miles down between Tornapress and Applecross, a mountain road which would be world-famous if it were not so remarkably inaccessible. If this hill and its surrounding scenery could be bodily translated to within fifty miles of Coventry or Birmingham, it would benefit the motor industry as profoundly as Brooklands track has already done; and it would be a place of resort for every tourist in Great Britain. Crags, lochs, eagles, and deer relieve a massive landscape which is almost overpowering in its splendour.

Technically the hill—especially the climb from the Jeantown side—ruthlessly searches out and punishes any weakness in an engine. Standard cars often spout boiling water like a Yellowstone Park geyser in their effort to surmount it, and may take years off the life of their brakes in the descent. Any motor cycle engine which has the least tendency to distort will hammer as if Thor's anvil were working on a rush job. To sum up the approach side tersely, you begin with four miles of collar work which can be done on top gear if you are a deft driver with a first-class engine under you, but which will demand lots of second gear from the ordinary touring duffer. The last mile includes lots of 1 in 5; has patches of the kind of surface which makes you bite the tip off your tongue; and contains three hairpins which cause cars to reverse, and are equal to un-

APPLECROSS. A hill that ruthlessly searches out and punishes any weakness in an engine.

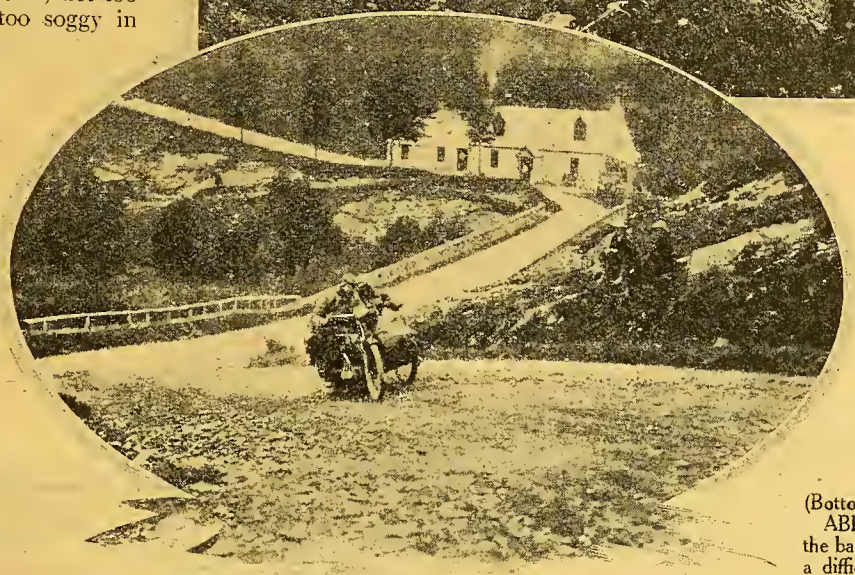
**Famous Scottish Hills—**

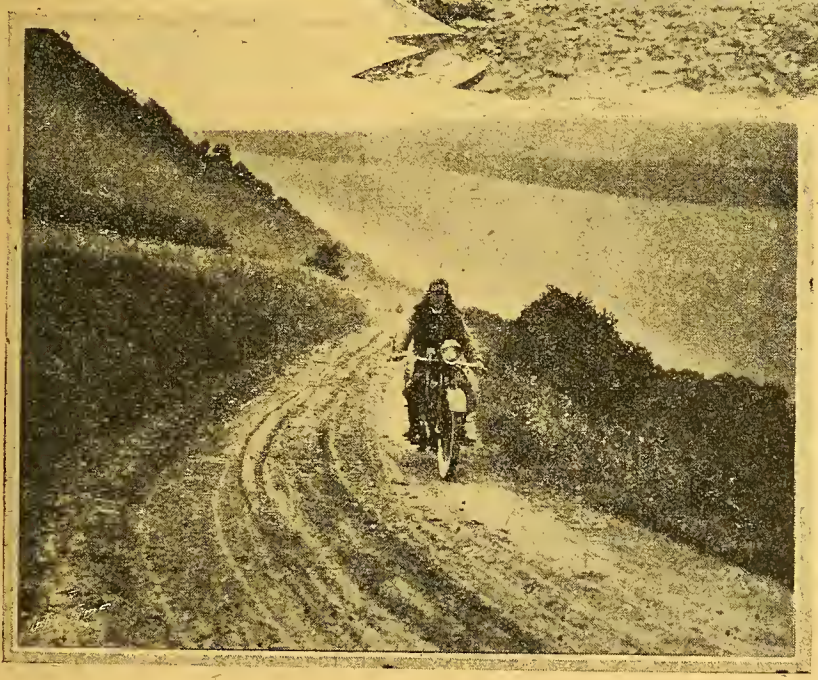
saddling a first-class solo rider if the Highland "haar" fills the air, and prevents you seeing in advance when and how the road intends to twist back on itself. The further side is a similar ascent of less severity. There is no climbing test in these islands which approaches the Pass of the Cattle.

For a trick hill, up which even a George Dance could hardly guarantee to make an absolutely clean climb at the first time of asking, or at any time of asking on a wet day, commend me to Inverfarigaig Corkscrew. A narrow road, barely wide enough for a Morgan, is scooped out of the sheer face of a pine wood, so steep that the loops mostly boast 1 in 5 hairpins; and there are seven or eight of them. At each side of the road is a narrow track of sandyish turf, not too firm on a dry day, not too soggy in rain. Up the centre is a trough, two or three feet wide and perhaps 9in. deep, of loose sand, which seldom becomes really muddy, but never hardens.

The problem is to cross the trough between each pair of hairpins, for they must all be negotiated on the outside if your knee is to clear your bar when the helm is put hard over. A few plunges and an anxious patch of wheelslip are the least you can escape with if you cross the central trough clumsily. If you take the hairpins fast, and you boggle your steering at the corners, a comical failure is your lot. Sidecars and cycle cars are very easily capsized on two of the bends, even by trials experts. It is emphatically a hill on which to be a spectator rather than a competitor, and if you can climb it with your feet firm on your rests all the way up, you know how to sit a machine.

Two good practice climbs for ambitious amateurs are to be found at Amulree. The climb from the Crieff side is dear to the Edinburgh Club, whose experts say they never feel quite sure of it. I do not rate it so highly as that myself. There is a lot of rough





(Top.) AMULREE. A difficult climb famous for its awkward and very acute S bend.

(Centre.) BRIG O' BROWN. Between Tomintoul and Carrbridge.

(Bottom.) ABRIACHAN. On the banks of Loch Ness, a difficult hill for sidecars in particular.

**Famous Scottish Hills.—**

collar work before you tackle the famous or infamous S bend, on which the surface is generally in process of decomposition. This makes you skid and wobble, and before you have time to resteady the bus, the second bend is upon you, and is extremely acute. Take it wide and slowly; then there remains half a mile of rough single figure gradient.

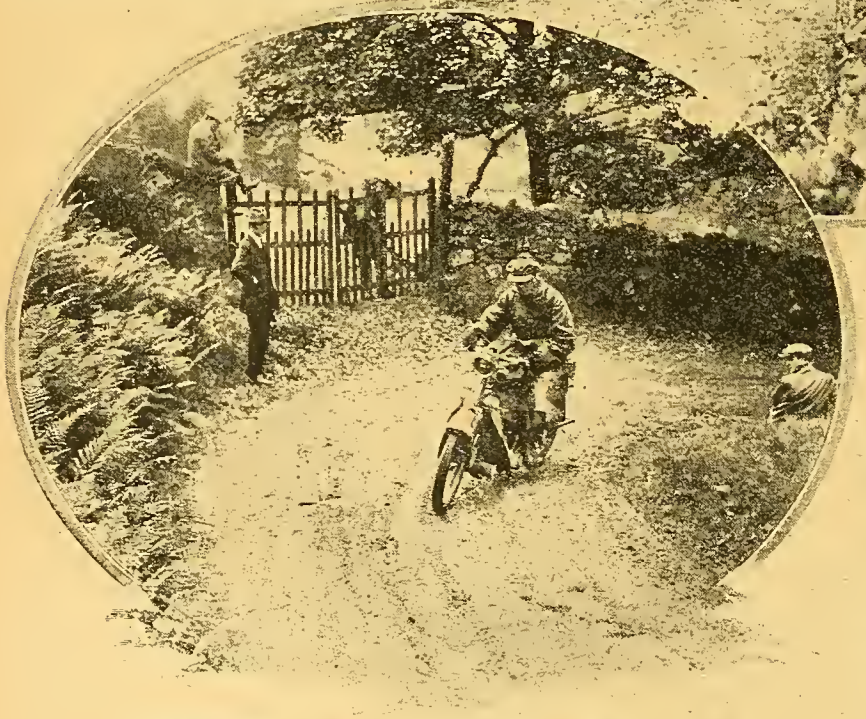
The Kenmore side is stiffer, and has one excessively awkward snag. Just above the worst corner, which is sharp enough in all conscience, a reef of naked rock crosses three-quarters of the road and projects appreciably above it. Your machine is crawling as you round the bend, and, unless you are very lucky, it is also buckjumping. You must regain sufficient control to dodge that reef; otherwise there will be a colossal plunge, and you can thank your stars if the climb does not terminate abruptly there and then. Once past this reef, the rest is plain sailing.

Cockbridge Ladder, between Balmoral and Tomintoul, is yet another hill for which the older brigade of Scottish Six Day men have an unfeigned respect. But I rather fancy that this reverence is more concerned with single gears than with the actual severity of the climb. The road is—or was—exceptionally narrow, and winds eternally with mild corners up the slope of an absolutely interminable moor. When the ground rises with the hill, gradient is always deceptive; and there is no downward peep into a dizzy gorge to convince one that the road rises one yard in every half-dozen, so that the engine seems to be seizing. This climb can be greasy in "saft" weather, especially towards the foot, an added terror from which most Scottish climbs are fairly free. I have seen good men and true conk out on this climb, or jolt clean off the road into the heather, or upset their sidecars. But an inner instinct assures me that it is not really very formidable on a modern machine.

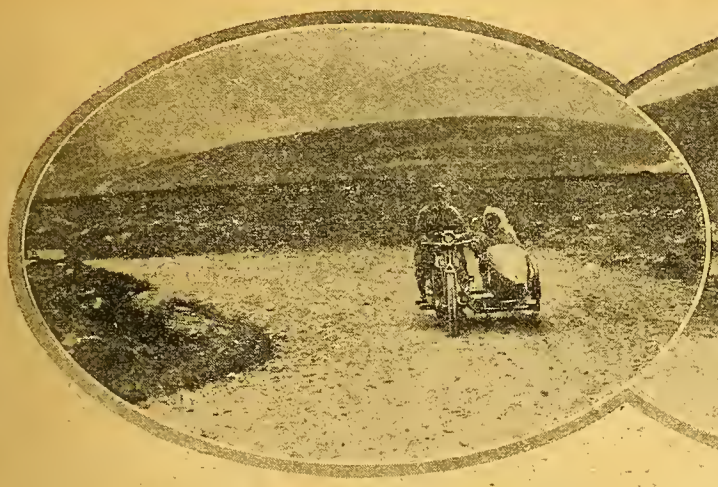
In either drizzle or downpour the Scottish clubs can readily list the sort of hill on which a stoppage robs you of your gold, for some of their hills boast very deep and lengthy patches of pale fawn-coloured powder, which looks like sand on a sunny day, but proves that it is only pulverised earth by relapsing into the stodgiest porridge when it is wet.

Abriachan is a good example. Last summer it was coated with seven or eight inches of browny-grey dust at its worst corner; I have known it be nearly hub deep in a filthy clinging slime, which absolutely nullified tyre grip on the rear wheel of a sidecar and robbed one of steering control on a solo mount. On Trinafour there is a deep corner of the same stuff, round which my bicycle once became absolutely unmanageable on a descent. The latter can be the very stickiest corner I know; but Abriachan is rather terrifying, as a plunge down a deep slope is the penalty of a generous skid.

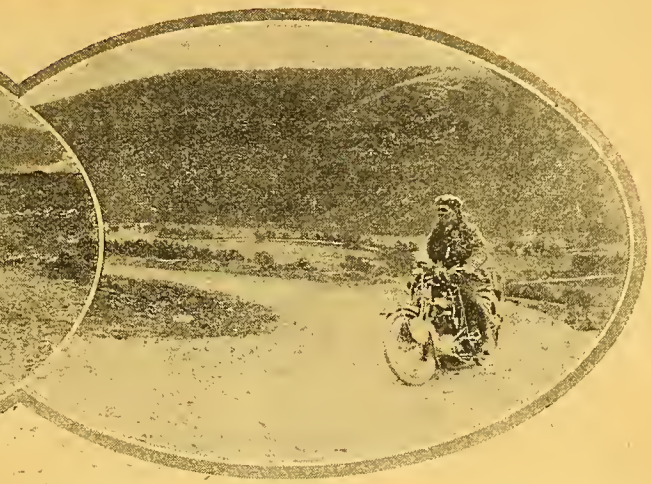
TALLA LINN. A hill, included in the 1920 Scottish Six Days Trials, which proved less formidable than was anticipated.



KENMORE. At the foot of Loch Tay, a rough and twisty hill.



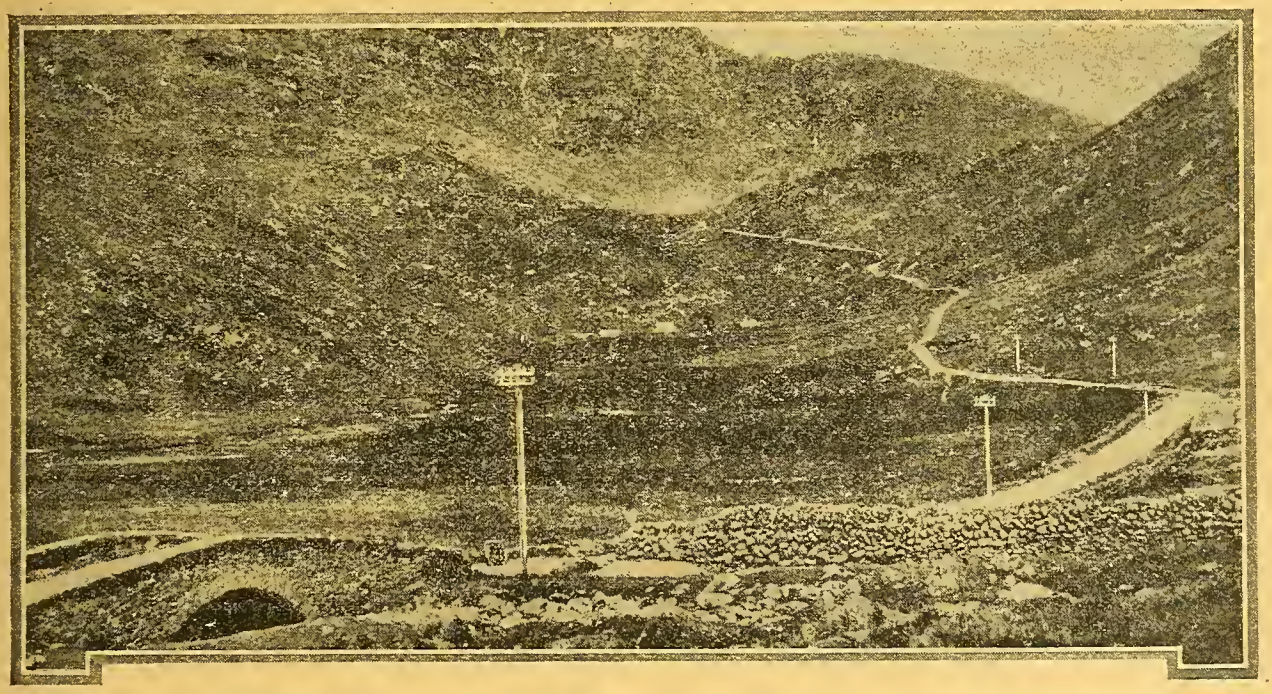
CAIRN-O'-MOUNT. Not a serious test for the modern machine.



TRINAFOUR. Once formidable, but now treated almost with contempt.

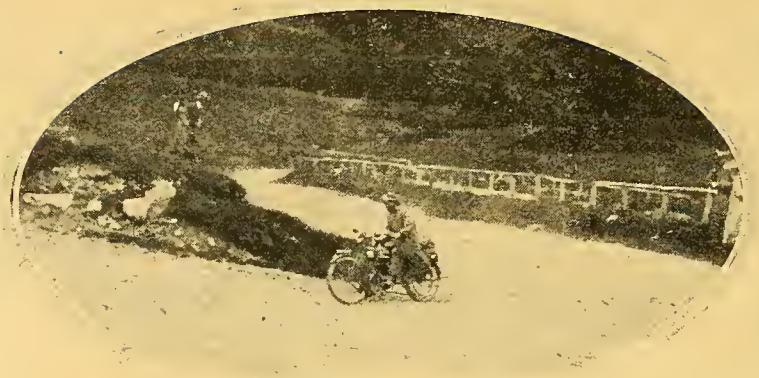
I had almost forgotten "Rest and Be Thankful." There is no excuse, for I once climbed it on a two-speeder with handlebar gear control. The "control" possessed no leverage, and the thrust of the engine was so urgent that the full power of one arm was required to keep low gear engaged. The road was far rougher than it is nowadays, and it is never easy to steer a plunging machine one-handed. Moreover, the sides of the road were littered with sidecars which had heated their cylinder bores egg-shaped. Moreover, the wind was astern, and I dared not stop to rest my aching fingers, for I knew it was touch and go whether my engine might seize before the summit. Nowadays the once invincible "Rest" is a duffer's climb. Some five miles separate the base from the apex, but the gradient is comparatively mild, and the solitary hairpin at the summit is so wide that a tank could take it at speed. But with a single gear and a following wind it used to be a teaser. Ask Allan Hay, who once carried a 2 h.p. lightweight up it at dead of night, with the aid of a Norton rider named Donaldson, and afterwards tramped back to the bottom to help in pushing up the Norton, which had a Brooklands pulley. They reached the night-stop just as the rest of the men were starting breakfast, and much to their credit they replenished with ham and eggs and clocked out on the tick with the rest of us.

Cairn-o'-Mount is seldom heard of nowadays, neither is the Spittal of Glenshee. The latter consists solely of an S bend, which looks most alarming, and lends



REST AND BE THANKFUL. A main road climb and probably more familiar by name than any other Scottish hill.

**Famous Scottish Hills**—itself admirably to the art of the stunt photographer, who can make it look simply frightful on the printed page. But honesty compels us to admit that it is a childish ascent nowadays, and I fear the same is true of Cairn-o'-Mount. But the latter has bitter memories for some of the old brigade who cannot bear to hear it lightly spoken of.



SPITTAL OF GLENSHEE. Known as the "Devil's Elbow"; it was included in the 1912 Scottish 6 Days Trial.

Many of us have climbed Cairn-o'-Mount on single gears. But time was when the moor sank for about 100 yards in the landing which separates the first flight from the upper steps. Local farmers choked up the subsidence with cartloads of rubbish, peat, boulders, turf, and what not. Then the Edinburgh Club put us at it. The aforesaid carts had ploughed two gigantic ruts through the soft litter which floated above the subsidence. Numbers One and Two steered joyfully down the twin ruts. The ruck followed anxiously Presently each rut narrowed, and the foot-rests of the leading men began to foul the high sides. We watched from the rear their increasing wobbles with fear and oaths. Ere long the entire trial was floundering in the litter, cursing as nobody ever cursed before or since. 'Twas not so bad for some of the men, who had two-speed gears. My own gear had seized up solid earlier in the day; and how could I re-start on a grade of 1 in 9? I did re-start — many, many times; but my wind gave out with frantic galloping alongside, and I pushed up the last mile, including the two corners where the grade is fair to middling. Moreover, I was on time at the next check. That is why I am grizzled and short-winded to-day. Cairn-o'-Mount is thus worthy of some respect.

Little Gruinard is a baby hill, only included as a practical joke in Six Day routes. The Edinburgh Club are fond of pleasantries. So year by year they dig out some new hill which not one motor cyclist in a million has ever seen. On the Sunday before the trial they excite the hapless Southron with their national beverage, and then proceed to stuff him up with appalling accounts of the new hills. The result is that he starts the Trials in a very windy condition, and corners like a badly balanced wheelbarrow. But in 1921 the joke was the other way round. The club pathfinders were sent to inspect a suggested hill on a "cauld, cauld neet."

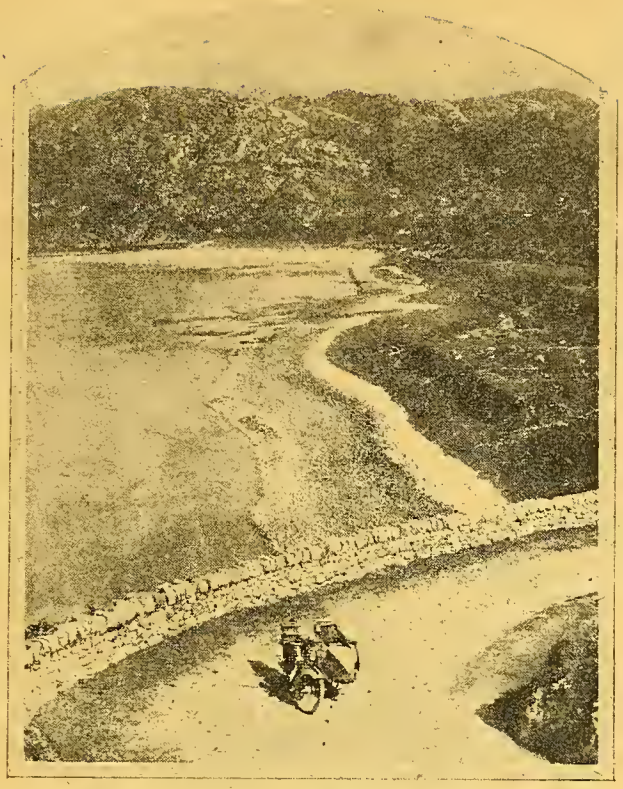
Scotland has a national recipe for averting frostbite and pneumonia. The pathfinders utilised this recipe. When they reached the hill it was dark. The above-mentioned prescription has a well-known effect on the optic nerve. The party screeched slowly up the hill on

GLENDOE. Near Fort Augustus—a scene on the lower and easier portion.

**Famous Scottish Hills—**

bottom gear, and averred to each other that the beam of their headlights was only a few degrees short of the vertical. They returned to Edinburgh genuinely scared about the hill, and recommended that it was really too steep for inclusion. The club treasurer, in view of the high price of gold medals, voted for the hill and orated in its favour. It went into the programme. Being nearly three miles long, some twelve members of the organising club were marooned on that lonely moor to observe the hill. No part of Scotland is technically Pussyfoot, but in practice some areas are remote from licensed premises. This was one. I believe two decrepit machines failed on the hill, but that was nothing to the good, as they could hardly have waddled home if the roads had been dead flat. Anyhow, twelve irate observers will cast a solid block of votes against that hill figuring in any future event that may be held.

This catalogue of terrors, exploded or eternal, may fitly wind up with the name of the first Scottish hill which earned a reputation south of Tweed. Way up north, some forty miles from the finish of the classic End to End record, lies a tiny hamlet in a dip between two mild acclivities. Berriedale is the name of the hamlet, and by Southrons the name is extended to the two slopes which conduct one south towards civilisation or north towards the abomination of desolation.



LITTLE GRUINARD. An easy hill midst magnificent scenery on the coast north of Gairloch.

The early End to End record men had crude engines, cruder transmissions, and single gears. By careful route selection they could dodge every respectable slope between Land's End and John o' Groats, save only Berriedale. On one or other of these slopes, according to the end from which they started, all record aspirants pedalled like mad, till their weary legs were flying round in an invisible blur. They kept up the good work for a mile coming south or half a mile going north. So they had reason to remember Berriedale. When they talked of it in Midland or metropolitan clubs it was eight miles long, and had an average grade of 1 in 3. Hence its ephemeral reputation. Then motors improved, Highland touring came into fashion, we all went up to doff our caps to Berriedale—and roared up on top on half throttle!

B. H. DAVIES.

## MODERN FRAME DESIGN.

ALTHOUGH one often hears the complaint from riders that the main essentials of the modern motor cycle are practically the same as in pre-war machines, there are many recent productions which show that frame design, at least, is changing.

Of the new designs, there are several which are of more than passing interest, and, incidentally, it may be mentioned here that what is accepted as conventional in 1922 was regarded as heterodox as recently as two years ago.

The Beardmore-Precision is an excellent example. When this machine was introduced, it was regarded by many critics as a "peculiar" design, merely because its design differed from the stereotyped form. Excepting for its distinctive mechanical and constructional features, the Beardmore-Precision does not depart from what are accepted as conventional designs. In fact, if the outline of any nicely proportioned machine is sketched upon a piece of tracing paper and laid over a similar sized photograph of the Beardmore, it will be found that they synchronise. Whether this was by accident or design is a moot point.

Another recent design, the Ner-a-Car, is an entirely different proposition. Here conventional motor cycle practice has been entirely ignored, or, perhaps, it is safe to say, avoided. An American design developed in this country, the Ner-a-Car strikes many new notes in motor cycle design. One of its chief characteristics is its remarkably easy steering and balance, the latter due to the low centre of gravity.

The Unibus is another design showing a marked advance on pre-war practice. Unfortunately, perhaps, the design has been confined to a scooter type of vehicle. Anyone who has examined the Unibus at the two Olympia shows where it has been exhibited must have been impressed by its mechanical excellence. Here, again, the outlines produced by evolution were ignored, and one could not say that it suffered on that account.

Among other new designs that are different, the A.B.C., Peters, and Hagg may be mentioned. There are others, and altogether there is every indication that frame design is not being allowed to stagnate.

VEDETTE.

# Club Life Across the Border

## Scottish Clubs and Scottish Riders.

THOUGH there are eleven provincial clubs affiliated to the Scottish Auto Cycle Union, and others which have not yet become affiliated, it cannot truly be said that minor club life in Scotland is such an active success as in the more thickly populated portions of England. There is a very evident reason for this, for Scotland is rich in sports to which the motor cycle forms a useful, indeed, an almost indispensable, adjunct, but which are outside the circle of club control. One finds that almost every motor cyclist north of the Tweed is, for example, a keen fisherman, and fishing can be had almost anywhere in the land of the heather, while the same, of course, applies to shooting. These interests claim a very large proportion of the motor cycle fraternity at times when, in districts less liberally endowed with outdoor interests, the sporting rider is happy to look to the social intercourse of his fellow riders.

### Famous Clubs and Important Events.

It is owing to Scotland's sporting resources that the provincial secretaries and club captains experience some difficulty in marshalling the unanimous interests of their flocks; but it is superfluous to add that there are in Scotland two or three clubs which are keenly alive, and already rightly famous for the excellence of their organisation and the keen interest displayed in their trials.

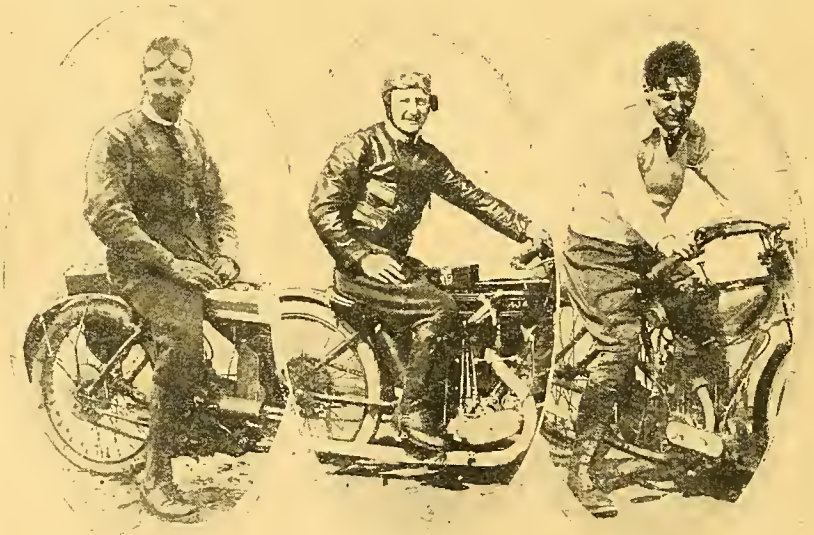
In this direction the Edinburgh and District Motor Club is the oldest and the best known. Campbell McGregor has for a long time stood out as a prominent figure in the organisation of Scottish Trials, and is still Secretary of the Club. As the result of long experience, the Edinburgh Club has found that it is detrimental to the interest displayed to hold events regularly every Saturday, and, accordingly, the Club has adopted the policy of organising fewer events and attaching to each a greater importance.

SCOTTISH SPEED CHAMPIONS FOR 1921.

Heavyweight Class: R. J. Braid (7-9 Indian).

The two most outstanding events of the year organised by Edinburgh are, of course, the Scottish Six Days and the Scottish Two Days. The arrangements for this year's Six Days are well in hand, and the preliminary regulations should be in order very shortly. The trial is to be held the first week in May, and since this early date entails some risk of bad weather, it may be found necessary to have in reserve an alternative and less mountainous course. If the weather is to be worse than we have known it during certain preceding "summer trials" in Scotland, we sincerely hope that the alternative course will not be too Alpine! This year, as last, the plan of doling out the awards on the last day of the trial is to be adhered to.

The Edinburgh Club is blessed in possessing many car members who are keenly interested in the motor cycle events, and whose generous help has everything to do with the success of the big trials.



Medium Weights: J. R. Alexander (3½ Douglas).

Lightweights: A. L. Downie (2⅝ A. J. S.).

"Featherweights": R. W. Wilson. (2¼ Hobart).

### Other Prosperous Clubs.

The Glasgow M.C.C., of which L. C. Hilyer is Secretary, is an old and honoured institution with many able riders among its members; while the Glasgow Western M.C.C. has obtruded itself upon

**Club Life—**

the notice of Northern motor cyclists during the last two or three years. Last year they held a number of important events, many of which were well patronised by English riders; their list was a very full and comprehensive one. Mr. J. Robinson, the secretary, and his host of able satellites, are to be congratulated upon their enterprise, and it is to be hoped that the coming season will see their efforts still further rewarded.

Some of the officials of the Edinburgh M.C., organisers of the Scottish Trials. Messrs. W. Fraser, W. M. Smellie, R. R. White, A. G. Ballantine, Campbell McGregor, R. Dixon, J. Benton and Donald McKay.

We append a list of the more important Scottish motor cycle clubs affiliated to the governing body, together with the names and addresses of their secretaries.

Beith and District M.C.C.
Sec., Robert Balfour, Craigvue, Beith.

Clackmannan County M.C.C.
Sec., John J. Christie, Rosegarth, Tullibody Road, Alloa.

Coatbridge, Airdrie and District M.C.C.
Sec., James Monteath, Kirkland House, Blairhill Road, Cambridge.

Dundee and District M.C.C.
Sec., J. Robertson, 12, Victoria Chambers, Dundee.

Edinburgh and District M.C., Ltd.
Sec, Campbell McGregor, 6, Castle Terrace, Edinburgh.

Falkirk and District M.C.C.
Sec., A. Neilson, Stewartfield, Falkirk.

Glasgow M.C.C.
Sec., L. C. Hilyer, 447, Sauchiehall Street, Glasgow.

Kelso and District M.C.C.
Secs., D. S. Anderson, Greenlea, Kelso; A. F Morse, Ramsay Lodge, Kelso.

Montrose and District M.C.C.
Sec., Arthur D. Jolly, 116, High Street, Montrose.

Western M.C.C., Glasgow.
Sec., J. Robinson, 1, Yarrow Gardens, Kelvinside, Glasgow.

West Fife, M.C.C.
Secs., T D. Gordon Watt, Douglas Street, Dunfermline; W. Joanes, Hospital Hill, Dunfermline.

Scottish riders who are not as yet members of their local organisation should bear in mind that by becoming members they will act not only directly to their own benefit, but will further the strengthening of motor cycle interest.

Frequent Competitors in Scottish Trials, Mrs. Bell (shown in inset) being quite as enthusiastic in trials riding as her husband, Duncan Bell, who is depicted negotiating Glendoe.

### The Scottish Speed Championship.

Passing commentary on Scottish events would not be complete without mention of the Scottish Speed Championship, organised by the S.A.C.U., and held annually at St. Andrews. This is a really excellent contest, and, though a perennial success, it has always been a matter of some disappointment to ourselves that it has received but indifferent support from riders south of the Border. The fact that Scotland has a sufficient number of speed men to make an independent success of the event does not reduce the demand for outside riders, particularly those able Yorkshiremen who are within a full day's journey, and who might add savour to the happenings by vieing with the hardy Scot.

### Scottish Riders.

Turning now to Scot-

**Club Life—**

tish riders, there are so many bright stars, and space permits the mention of so few, that the task is a difficult one. The following names, however, occur immediately to one's memory:—Graeme Black, the Alexander brothers, George Grinton, A. J. C. Lindsay, A. L. and A. F. Downie, Roger Macrae, Claude Duncan, D. S. Milne, R. J. Braid, H. E. Fairley, Duncan and Mrs. Bell, R. Carfrae, W. Deans, J. Steel, W. Morton, and our apologies to those who momentarily escape memory.

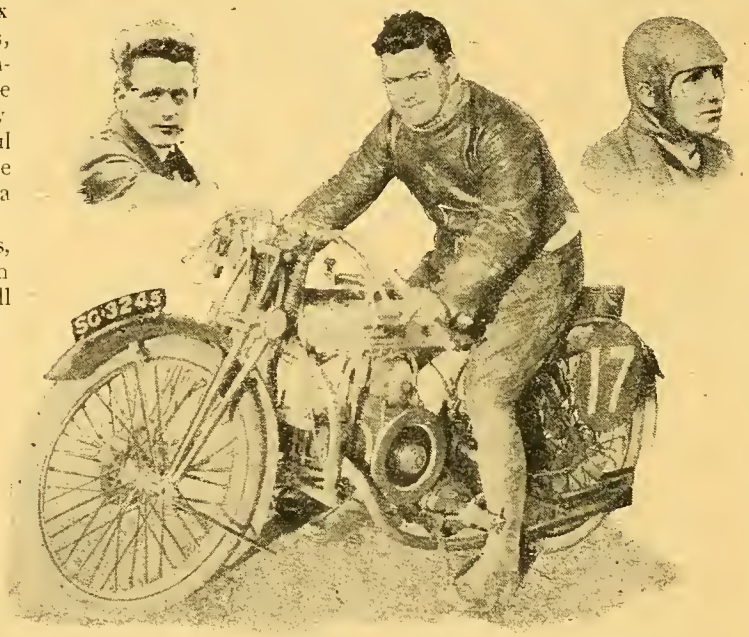
### Hard Riders.

Graeme Black is principally a speed man, and probably deserves the palm for Scotland, though he is very closely rivalled by the Alexander brothers, George Grinton and Alf. Lindsay. The last named sportsman confines himself mainly to reliability events in these days, but he has, of course, put up many excellent speed performances in the past. The same remarks apply to James Alexander, whose record is a most remarkable one, dating far back into pedal cycle days, and the popular James still manages to hold his own in a stiff scrap. A. H. Alexander is a superb speed rider, and "D.S." distinguished himself long ago by riding two laps of the T.T. without a saddle—an illustration of the hardiness of Scottish riders. Grinton generally manages to annex his share of the awards, whether in speed or reliability, north or south of the Border. He is certainly one of the most successful competition riders of the day, his mount being a Harley-Davidson.

The Downie brothers, generally mounted on A.J.S. machines, are all good riders, and have done consistently well in Scottish trials, while Roger Macrae is a dashing rider possessed of a very nice judgment. Claude Duncan has done well in speed and in reliability, and adds to the cheeriness of most Scottish trials, while D. S. Milne, though badly disabled in the war, deserves congratulation on his many successes.

R. J. Braid is an exponent of big twins, and has twice proved a St. Andrews victor; his brother O. C. Braid vies with him closely. Harry Fairley is young, as also is W. Morton, but both are full of promise. Duncan Bell is, of course, well known, and Mrs. Bell has ridden with astounding success in trials so severe that there were but one or two survivors, practically no clean sheets, and a pathetically small demand for premier awards. Among lady competition riders of Great Britain to-day Mrs. Bell holds a very high place.

R. Carfrae, apart from other distinctions, won his way to popular notice as being the sportsman who rode a single-geared Triumph through the Scottish Six Days two seasons back, dismounting at the foot of every observed precipice to cast off superfluous clothing and screw open his belt pulley. W. Deans is a distinguished reliability rider of the west, and J. Steel was a rider of inimitable style till a year or so ago he met with an unusually severe smash, which has since laid him more or less *hors de combat*. May this season see him back on the road again. James Alexander, of Corstorphine (unrelated to the brothers three), has also done well.



POPULAR PERSONALITIES IN SCOTTISH CLUB LIFE.

A. H. Alexander, a Douglas exponent who has an international reputation as a speedman. (Inset, left) D. S. Alexander, the youngest of the three brothers Alexander, a keen T.T. rider and also a trials rider often seen in English events. (Inset, right) George Grinton, a Harley-Davidson enthusiast known on both sides of the border.

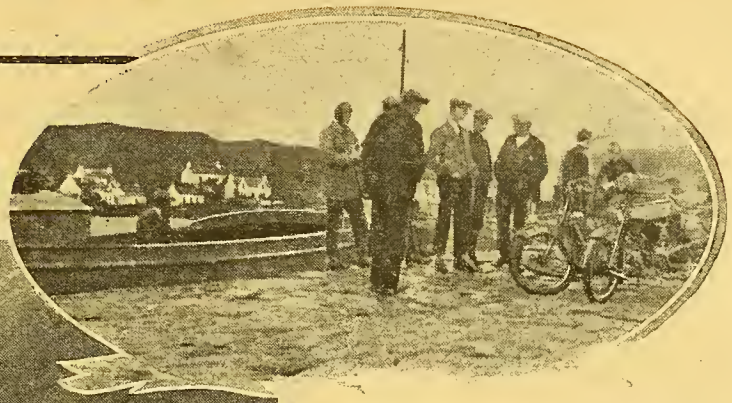
### Scottish Trials.

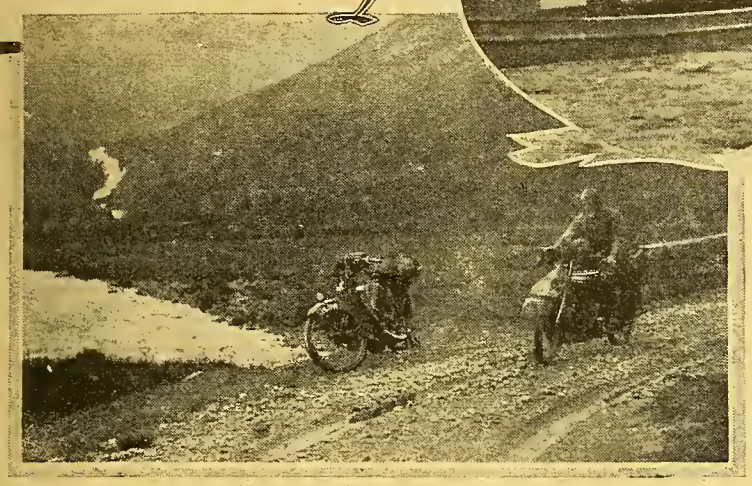
While Scottish trials are unrivalled for magnificence of scenery and a distinct novelty in the way of weather, it must not be thought that their severity is such that only a braw Scottish laddie who was born and nursed at the brink of a giddy precipice stands the faintest chance of survival. We have repeatedly known Englishmen who have never before ridden in any kind of competition to enter the Scottish Six Days in order to see the country, and actually to carry off a premier award. Such a visit at any rate enables one to make the intimate acquaintance of some of the best sportsmen and most generous "officials" in motor cycle circles, and we need only quote the official verdict in disputes, which has all but passed into an adage, "Gie the lad his medal!" H. M B

---

ENGLISH motor cyclists who project tours in Scotland often wonder how they will fare on account of the sparsity of hotels, especially in the Western Highlands. In the touring grounds of England almost every cottage and farm accommodates visitors, but in the Highlands one is practically entirely dependent on the hotels; so should they be full, one is likely to find an *impasse* on occasion. The Highland hotels, however, are commodious and the proprietors obliging.

# To the Isle of Skye





## A Trip on a Scott and a Norton to a Little-known Corner of the British Isles.

(Left) On the rough track near Sligachan.

(Right) About to embark on the ferry at Kyle Akin.

OF all the remote corners of Great Britain there is no spot with such a peculiar fascination of its own as the Isle of Skye. It is a land of waterfalls and peaks and loose soft roads, either grass-grown or cut with an amazing variety of ruts and channels.

"Ski" is a Scandinavian word meaning cloud, and the tourist is well advised to study the weather prevalent in the Western Highlands before setting out on his journey. June is the most reliable month, and the early autumn is preferable to August, for it is then that the heather in Skye seems to glow with a richer colour than elsewhere, striking a glorious contrast with the blue and black tones of the lochs and kyles. It is not a journey to make alone, as at some places one may be thirty miles from assistance or supplies of any description.

### Forebodings!

Our respective mounts were a Scott and a 4 h.p. Norton, and at the outset speculation was rife as to whether it would be the Scott that might have to tow the Norton or *vice versa*. However, no emergency called for the use of our four yards of rope.

Leaving the West Riding of Yorkshire by the Great North Road, from Scotch Corner we followed the valley of the Tees to Alston, the highest town in England, joining the main Carlisle-Stirling route a few miles north of the former place. This route to the north can be highly recommended. The road over Shap, on the west, is at present in bad condition, and on the Carter Fell route in the east there are six miles of absolute horror near Otterburn.

With the exception of Stirling and its environs, the surface was good the whole of the way to the Trossachs, and it was not until we had turned westwards at the summit of the Perth-Inverness railway, along the shore of Loch Laggan, that the roads began to deteriorate. At Spean Bridge the route along the Caledonian Canal was taken as far as Glen Garry and thence over a mountainous track to Cluanie Inn, a spot, according to Dr. Johnson, as remote from the haunts of man as it is possible to find in these islands.

### Primitive Road Repairing.

On this stretch we met two Highlanders repairing the road; one had a pick and the other followed a few yards behind with a rake . . . . From the solo rider's point of view the unrepaired road was far better than that which had been "treated." Fifteen miles further on we halted at the foot of the fearsome "Mam Ratachan," a hill negotiated in the 1920 Scottish Six Days Trials. Here the road winds its tortuous length up a shoulder of Ben Scrial, and a skid on the wet grass near the summit might mean a plunge down sheer one in nothing to the road several hundred feet below. Once over the top one can run free for about five miles down to the peaceful village of Glenelg, where there is a very excellent hotel.

The ferry at this point over Kyle Rhea to Skye was, years ago, the main crossing for all sheep and cattle passing over to the mainland; but now we found the old ferry boat rotting on the seashore and the jetty covered with seaweed and rushes. However, the proprietor of the hotel kindly agreed to take us over in his private motor launch, and after waiting for six hours for the tide to float the craft, we embarked from the seashore with the aid of two stout planks. The motor cycles were securely roped in, a precaution which we found to be quite necessary when we struck the wind driving up the Sound of Sleat.

### "Having Crossed the Rubicon."

In spite of the tide, which was running at a good fifteen miles an hour, an excellent landing was made, and the planks once again did great service in lever-

**To the Isle of Skye.—**

ing the machines over the side of the boat and down on to the jetty.

We bade good-bye to our muscular pilot, and, with the ferry boat a mere speck on the sea and a feeling of having crossed the Rubicon, we started to attack the very stiff gradient in front of us.

The road here very much resembles that at Altnaharrie, on Loch Broom, and commences straight from the water's edge with a gradient of about 1 in 4. In parts this mountain road has been washed away by waterfalls and the gulley filled in with boulders and shingle, but the surface improved somewhat after Glen Arroch as we neared Broadford, a peaceful fishing settlement, the second largest on the Island.

### Motoring and Walking in Skye.

Motorists may be well advised to take a supply of oil into these regions, as, although petrol is obtainable at several points, the only lubricant to be met with seemed to be "Ford oil." With vast panoramas of wild heath and towering peaks, rock-strewn coast and winding inlets, and stretches of placid blue sea, the next fifteen miles of road is remarkably fine.

The fine old inn at Sligachan, the haunt of climbers and anglers, nestling at the foot of Sgurr-na-Gillean (the Peak of the Young Men), the easternmost buttress of the famous Cuillin Hills was finally reached. Here before us lay some of the finest scenery of the whole tour, but it was quite inaccessible as far as a motor cycle was concerned, so we tucked our machines away in the hotel garage and set out on foot.

A word of warning here about garages in the Isle of Skye. 90% of the roofs leak badly, and the writer found, two days too late, that a good half inch of real Scotch rain had dripped on to his carburetter and found its way inside, as rain will.

The best walk from Sligachan is to Loch Coruisk, a sheet of water occupying the crater of an old volcano, a scene of utter desolation and awe, the scene of Bruce's landing in "The Lord of the Isles," and described with great force by many able pens.

At Sligachan the road forks, that to the left, leading to Dunvegan, being the more picturesque and having also the better surface. Midway between Sligachan and Dunvegan is the quaint Struan Inn, where a boat may be hired for the trip to Talisker Head, where the cliffs rise a sheer 1,000ft. from the sea.

### The Capital of the Island.

Dunvegan itself is rather disappointing, the main centre of interest being the Castle and the beautiful wood surrounding it. From Dunvegan the road passes by Loch Snizort to Portree, the capital of Skye. Here is oil and petrol in plenty, and a very useful and diligent blacksmith. After a glorious week of "pottering" about we returned to Kyle Akin and took the ferry across the Kyle of Lochalsh to the mainland, the charge being a modest 2s. 6d.

Ferry charges in Scotland are truly and wonderfully inconsistent, in one place a charge of a shilling or two will be made for quite a big crossing, in others one dare not reckon the ferry tolls in terms of cost per mile, for the result would make an appalling peak in the curve of one's running expenses.

### Our Mounts.

Here a word of praise for our machines is not out of place. The Scott, of all cycles, is perhaps the best suited for holding the rough and loose roads of the North West, but the big Norton was also wonderfully steady on the atrocious surfaces. Neither stopped on a single hill, and our only casualties were one puncture and a stuck-up rocker arm in the contact breaker. The Norton with a Binks carburetter was doing 110 miles to the gallon, which was most satisfactory. The Scott, of course, could not be expected to approach such a figure, but the smooth running of the engine is compensation for a consumption in the neighbourhood of 65-70 m.p.g.

Leaving Loch Alsh another ferry had to be crossed at Dornie—we encountered five in all—and it was with a heavy heart that we sank below the crest of the hill on the road round Loch Duich. It was here that we caught our last glimpse of the Cuillin Hills and the misty Isle of Skye, knowing that we could not return for at least another twelve months to the land we had heard about in the fantastic tales of John Buchan and in "Mary Rose"—a land not only of rain and bogs, but also of sunshine and colour.

JOHN E. KILBURN.

(17-18)

# THROUGH FEMININE GOGGLES

ENTHUSIASTIC CLUB MEMBERS.—A group of lady motor cyclists (members of the Manchester M.C.C.) who are not one whit less keen on competing in club trials than their brothers. Reading from left to right, Miss Storer (Levis), Miss M. Cowley (Dot), Miss E. Cowley (A.J.S.), Miss C. Cowley (Sunbeam), and Miss D. Cowley on her scooter.

## Notes on the Choice of a Machine suitable for a Lady.

WITH the approach of spring, many lady readers of *The Motor Cycle* will be considering whether they will be content with a seat in the sidecar or whether they will be independent of their husbands and brothers, or other people's brothers, and launch out and purchase a machine of their own. Probably many prospective lady motor cyclists are wavering in their decision mainly from a doubt in their own minds as to whether they are capable of running a machine any considerable distance without mechanical trouble.

### Reliability of Modern Mounts.

On this point their minds can at once be set at rest, as at the present time the number of light-weight motor cycles available by different makers which can be absolutely depended upon for reliability is exceedingly large. The lady purchaser need have no uneasiness in this respect if a selection is made from any maker whose products hold a good reputation. No machine would hold the market for any length of time if it failed to come up to the standard at present demanded by the public.

The question arises as to what type of light-weight motor cycle is suitable for a lady about to take up the pastime. Undoubtedly the two-stroke may be considered satisfactory, and at the present time these may be purchased new from £50, with two-speed gears, kick starters, and other refinements.

The single-geared belt-driven two-stroke, which can now be obtained for less than £40, may be quite a satisfactory proposition for a man, but certainly cannot be recommended as an all-purpose machine for a lady.

Most two-strokes when in reasonable tune are fairly easy starters, but the spectacle of a lady trying to paddle off a single-geared machine which is slightly sluggish in starting is, to say the least, rather undignified. It may be fairly easy on a down grade or on the level, but the convenient down grade is not always available, therefore I do not advocate the purchase of a single-geared machine. That a large amount of enjoyment can be obtained from such a mount is undoubted, but for all-round utility a two-speed model fitted with a clutch and kick starter is certainly advisable.

The objections to a machine fitted with a two-speed gear only, without the clutch and kick starter, are somewhat similar to the single-geared mount, as the same difficulties as regards starting apply. In the case of a man, with a single-geared or two-speed machine he has merely to walk alongside the machine, and as soon as the engine fires vault into the saddle. Such a method of starting is not possible for a lady in conventional attire, therefore a clutch is absolutely necessary.

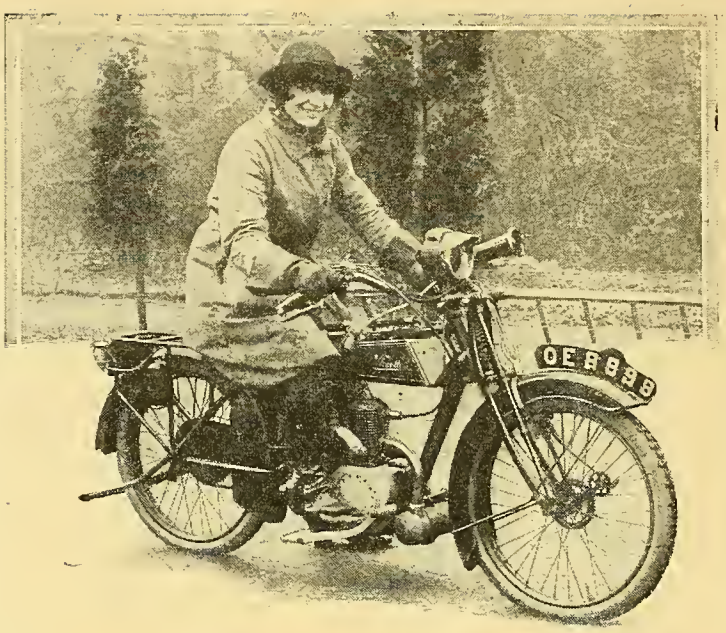
Where a clutch only is fitted in conjunction with a two-speed gear it is quite easy to walk alongside the machine till the engine fires, lift the clutch lever, and, bringing the machine to a standstill with the engine firing, take one's seat on the saddle, let the clutch in gently, and drive away on low gear; but having ridden many types of machines, I have come to the conclusion that the convenience and comfort of a motor cycle fitted with a clutch and kick starter are well worth the slight extra outlay.

### Four-Stroke v. Two-Stroke.

The four-stroke light-weight is still very popular, but to my mind there is not the smoothness in running for which the two-stroke is so noticeable. Another very great advantage of the latter type is the steadiness on greasy roads. There is not such a liability to skid, owing to the fact that there is an explosion to every revolution of the fly-wheel, instead of every two revolutions as in the four-stroke type. This steadiness in grease is a very great factor and should certainly be taken into consideration by the novice.

Two-stroke machines are not considered to be very fast, the highest speed which I have ever attained

**Through Feminine Goggles.**



A keen rider and club enthusiast on her Velocette—Mrs. H. G. Gale Hon. Sec. to the West Birmingham M.C.C.

on the six or seven machines I have ridden being in the neighbourhood of thirty-two or thirty-three miles per hour; and it was not advisable to drive them at this speed for any but a short distance, as excessive vibration, piston slap, and other petty annoyances began to be in evidence at a speed in excess of 30 miles per hour.

At speeds from twenty-two to twenty-eight miles per hour I usually found the running comfortable and smooth, some engines being better than others, of course, and at these speeds very long distances have at times been covered without trouble or over-heating.

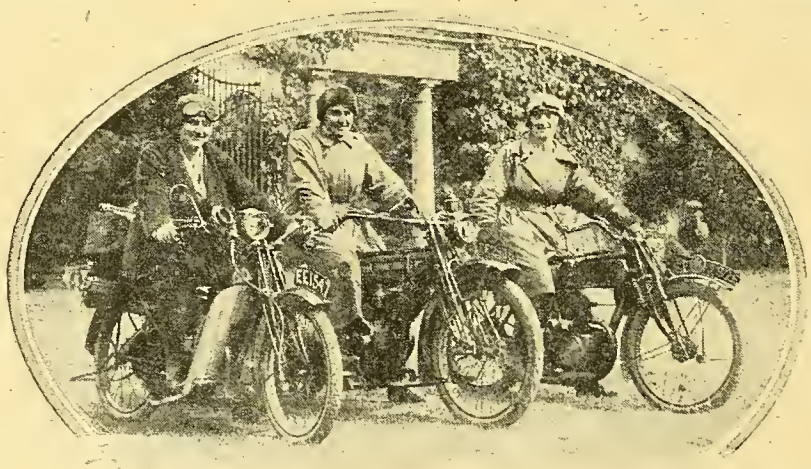
Several rides from 140 miles upwards were done last year without fatigue or discomfort, and on one occasion an actual average of 23 m.p.h. over a distance of 120 miles was obtained; but this was in the early morning on a midsummer's day, leaving the West of England soon after four o'clock. The good average was arrived at by settling down to a steady gait and making no stops whatever except one of five minutes to replenish the petrol tank. No high speeds were indulged in, but a regular steady pace maintained for the whole journey.

It may be suggested that long rides of this description on a light-weight machine would be fatiguing, but my experience is to the contrary, providing the riding position is properly adapted to the rider.

Very much depends upon the relative position of the handlebars, saddle, and foot-rests. The handlebars should not be too high and narrow, otherwise control of the steering is affected; at the same time, it is a mistake to go to the opposite extreme. A medium between the two is advocated, so that the handle grips are within comfortable reach without causing too much of a stooping position. A perfectly upright attitude does not give that secure feeling that one has when a slight amount of weight is thrown upon the handlebars. A large and comfortable saddle is most important, and many of the light-weight machines when originally turned out are fitted with a saddle much too small.

With regard to the question of whether foot-rests or foot-boards are advisable, personally I prefer the former, as the foot seems to have a better grip with these, with the consequent better control on greasy or bumpy roads. It is astonishing what a difference a few minor details such as these make to the comfort or otherwise of the machine. Many little alterations can be made to suit the personal tastes of the rider—for instance, the moving of the saddle backwards or forwards a matter of one inch will often mean the difference between an ideal riding position and discomfort; this equally applies to the handle-bars and foot-rests.

Several firms build open frame machines for the use of ladies, and it may be remarked that not many of these are seen on the road in comparison with the number of lady motor cyclists who are astride machines originally built for men. There are several reasons why the former are not more popular, and personally I have no hesitation in recommending the latter type. The open frame machines—at least those I have ridden—are much heavier, more awkward to handle, much more difficult to steer, and generally less comfortable to ride. Quite a number of machines of the light-weight type are fitted with 24in. wheels, which give a very low riding position suitable for a short girl.



A trio of lady motor cyclists, all of whom have covered long distances in severe trials. The two outer mounts are Velocettes and the one in the centre a P. & M

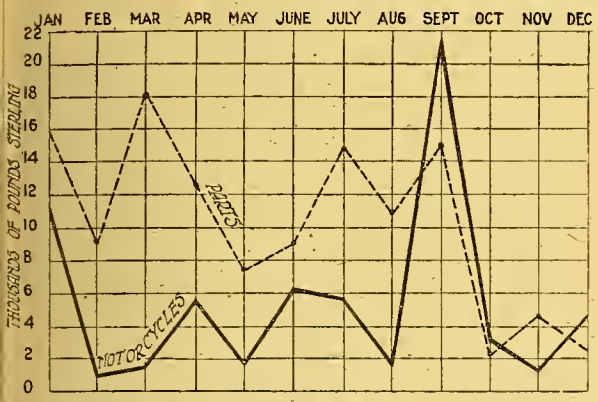
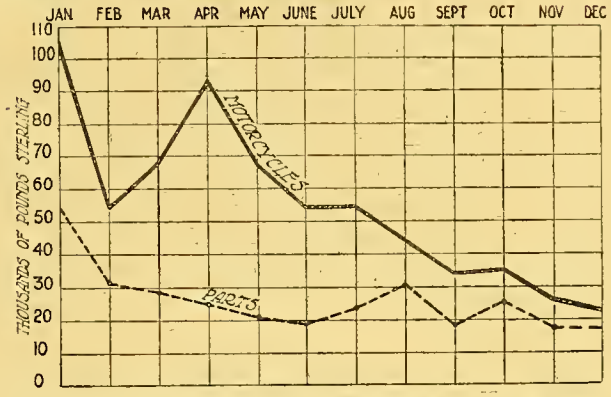
# IMPORTS AND EXPORTS.

## Dwindled Export Figures; Hopes of an Early Revival.



Showing the wide fluctuations in the value of motor cycle imports during 1921. The dotted line indicates the value of imported parts and accessories.



Denoting the continuous downward tendency of our motor cycle exports during the past year. The average of parts was fairly well maintained.

IT is common knowledge that 1921 has not been a prosperous year for British export trade; this applies to motor cycles as to everything else. Yet a glance at the complete returns for the year proves that the position is not really so bad as is imagined by some. When £979,684 worth of motor cycles and parts are exported in twelve months it cannot rightly be said that things have come to a standstill.

In 1920, however, as shown by the corrected "Trade and Navigation" returns the corresponding figure was £2,327,854, or considerably more than double.

The monthly fluctuations of the market may be followed on the accompanying chart for 1921. It will be observed that the tendency has been a gradual but sustained decrease since April. In 1920 the months of July to November inclusive showed the highest levels, but there was a pronounced drop in December. Indeed, the last month of the year has almost invariably been in the past one of the least satisfactory periods from the point of view of the motor cycle exporter. There is therefore no need to despair because December, 1921, has established another low level record. Everything points to an improvement in the near future.

### Last Year's Overseas Trade.

Reviewing the imports for the year, the most striking fact is that they, too, have fallen in almost exactly the same proportion as the exports. In 1920 £407,359 worth of motor cycle and parts were imported; in 1921 only £189,725.

Thus, the motor cycle exports for the year were still more than five times as great as the imports. This, in itself, is a source of some satisfaction, especially when it is recalled that the grand totals of all goods and merchandise entering and leaving the United Kingdom during 1921 show a ratio of 10 to 7 in favour of the exports.

As the first chart shows, the importation of motor cycles reached its zenith in September. Otherwise, there have been pronounced fluctuations from month to month, which cannot be attributed to any one definite cause. One curious fact, however, is worthy of note. Whereas £66,513 worth of "motor cycles" were imported, £123,212 worth of "parts" were received last year. Evidently a considerable number of machines are despatched in an unassembled state.

# THE A.C.U. ONE-DAY TRIAL.

## A Class for Stock Machines. Scooters and Motor-Assisted Bicycles Admitted.

THE Standard Stock Machine Trial which will be organised by the Auto-Cycle Union to run in conjunction with the One-day Trial on March 15th, is open to motor scooters, motor-assisted bicycles, motor bicycles, sidecar outfits and cycle cars. The last-mentioned vehicles may have three or four wheels, provided their unladen weight does not exceed 772 lb. and the engine capacity 1,100 c.c.

The trial should provide an excellent opportunity for a private owner to demonstrate the wisdom of his choice as a considerably reduced entry fee is charged to entrants who are not manufacturers or agents.

The start will be at the Ward End Works of Wolseley Motors, Ltd., Birmingham, and the conclusion at Brooklands Track, where a speed list will be carried out.

Entries close at midday on March 1st, and the fees are as follows:—Manufacturers or agents, £3 3s. per machine, or £7 7s. for a team of three riders; private entrants, £1 1s. each entry.

About 150 miles long, the course will be traversed at an average speed of 18 miles an hour. Arrival times will be taken only at the luncheon stops and at Brooklands.

Twelve laps (32.6 miles) will have to be covered at the following minimum rates of speed:—Class Z (motor-assisted bicycles), Class Y (scooters), and Class BS. (350 c.c. sidecar outfits), 20 m.p.h.; Class A (which has been extended for the purpose of this test up to 275 c.c.), 25 m.p.h.; Class F (600 c.c. sidecar outfits), 25 m.p.h.; all other classes, 35 m.p.h.

Certain hills, the position of which will not be published, will be observed, and a stop on any of these will entail a

**The A.C.U. One-Day Trial—**

loss of 5 marks. Stops will be recorded against competitors making use of extraneous aid in ascending hills (except in the case of motor-assisted bicycles), running alongside, kicking on the ground, or stoppage of the front wheel. No competitor who is baulked on a hill will be penalised if he restarts immediately.

No adjustments may be made throughout the trial, but oil, petrol, and water may be taken in at the luncheon stop, in the recognised controls or at Brooklands.

Every entrant completing the trial will be granted a first-class certificate, or in the case of stock machines a special certificate of merit.

The motor cycles entered are divided according to the international competition rules of the F.I.C.M. and must conform to F.I.C.M. requirements. The definition and equipment for motor-assisted cycles and scooters are given below :—

Class Z. A motor-assisted bicycle is defined as a vehicle having two or three wheels, provided that the third wheel, if any, should be for the purpose of propulsion only by mechanism actuated by the driver and/or a motor.

Class Y. A scooter is defined as a motor bicycle carrying between the wheels a platform, no part of which is more than 12 in. from the ground and of which the minimum length is 8 in. For both the above classes two efficient brakes must be fitted.

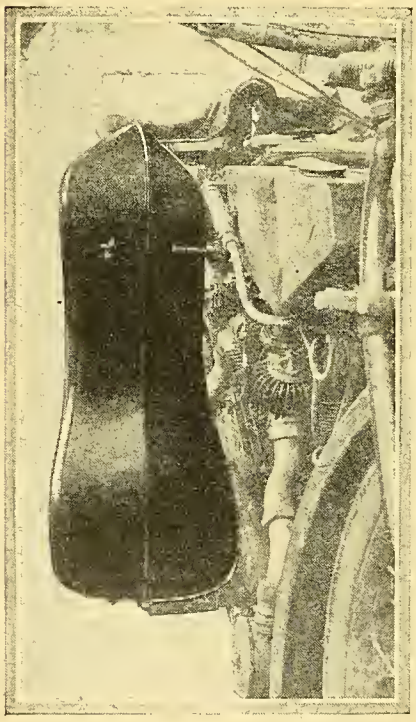
Manufacturers wishing to enter standard stock machines must notify the Union of their intention before February 15th, and at the same time authorise on the appropriate form the officials deputed by the Competitions Committee to select and seal the number of machines entered, which must then be dispatched to the Ward End Works of Wolseley Motors, Ltd., so as to arrive on Monday, March 13th, or Tuesday, March 14th. No selection will be made unless at least three times the number of machines entered are available for the purpose.

Half an hour will be allowed the riders of standard stock machines for making preparatory adjustments and trying the machines over a selected course prior to the start.

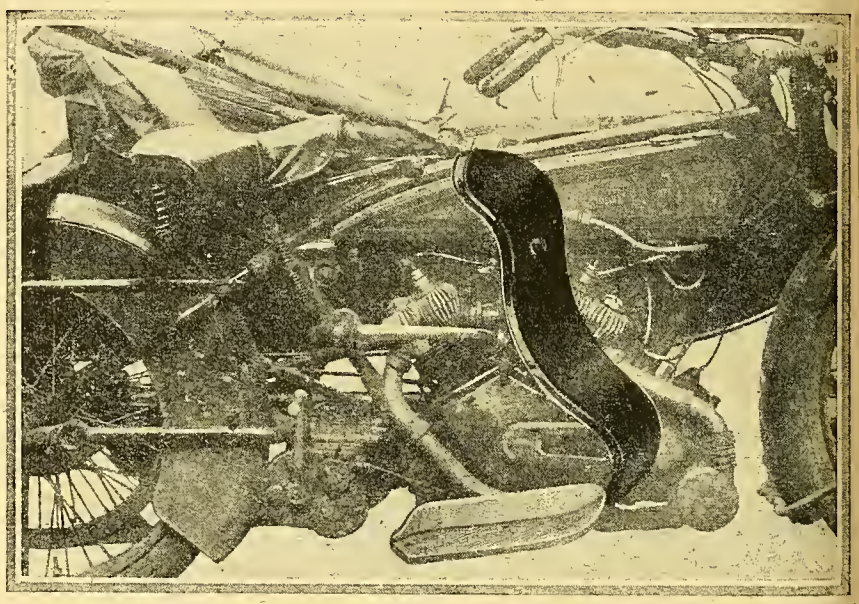
# LEG GUARDS ON TWIN MACHINES.

## Designing Mud Shields to Ensure Adequate Cooling of the Rear Cylinder.

LEG shields are now regarded by motor cyclists as essential equipment for winter riding. Several motor cycle manufacturers have come to realise this, and so equip their standard machines. A large number of owners of motor cycles not so fitted up avail themselves of the good services of those who specialise in the manufacture of leg shields. There are now quite a number of them on the market, ranging from sections of mudguards to one-piece devices of steel or aluminium. There is one which deserves the special attention of those who own twin-cylindered machines, for it does not follow that a shield efficient on a single will produce the same results on a twin.



Front view of the Speedwell leg guard, showing how the V section assists in directing a draught of air on to the rear cylinder of a big twin.

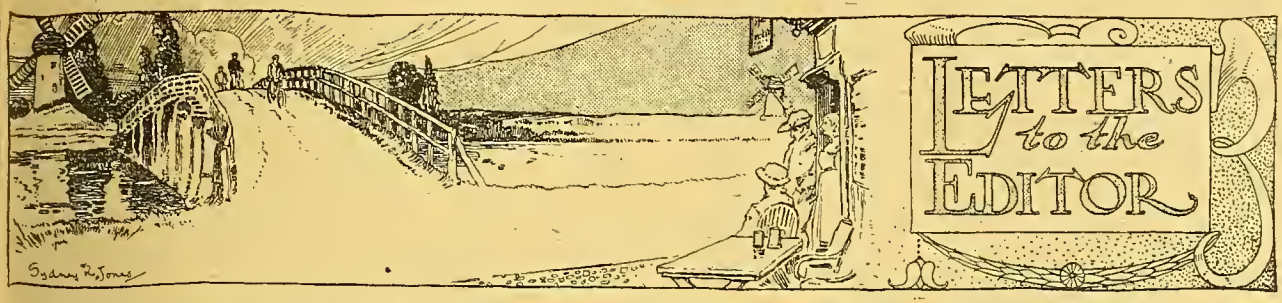


The peculiar shape of the Speedwell guard has a purpose which is apparent on reference to the other illustration.

A little consideration will show the reason for this. In most cases leg shields permit air to reach the cylinder of a single, but in the case of a twin the rear cylinder is "blanketed" by its fore companion.

Those of our readers who have seen the Speedwell curved leg guard may have wondered why the manufacturers have gone to such trouble in producing such an ornate design. The answer is immediately apparent upon glancing at one of the accompanying illustrations, from which it will be seen that, although the rider's legs are amply protected, the curved contour and the V section of the guards induces a current of air to the rear cylinder.

We have a pair of leg shields of this make in use at the present time and we find them all the makers claim for them. They are easily fitted and show no signs of rattling or drumming, so irritating with some shields. We have found that the rear cylinder keeps quite as cool as its fore companion; in fact, we are of the opinion that they would be beneficial in summer to ensure adequate cooling of the rear cylinder. The makers are The Speedwell Gear Case Co., Ltd., 276, Broad Street, Birmingham, a firm of many years' standing and well known to the "trade."



The Editor does not hold himself responsible for the opinions of his correspondents.

Correspondence should be addressed to the Editor, "The Motor Cycle," Dorset House, Tudor Street, E.C.4, and must be accompanied by the writer's name and address

## *TOURIST TROPHY RACES FOR PRIVATE OWNERS.*

Sir,—I have read with some interest the correspondence which has been passing regarding an amateur T.T.

I think such an idea would be very popular, and while the expense of participation would naturally be heavy, it need not approach the amount spent by the entrants in the existing T.T. race. If the idea is to be followed out logically, every entrant would have to prepare his machine without trade assistance of any kind. His mechanic and assistant would probably be a friend out for a holiday.

I think under a suitable system of rules the event would receive an astonishing amount of support. I can think of half a dozen riders in my own club who would welcome the idea.

You write in your leader that the difficulty of a definition of an amateur cannot be framed satisfactorily. I admit the difficulties, but the club I have represented for some twelve years has not found it insuperable. I enclose for your inspection a copy of our rules to note. If these are faithfully observed, there should be no doubt as to any but a strict amateur competing.

H. J. POOLEY,
Hon. Secretary, N.W. London M.C.C.

[Appended are the rules referred to by Mr. Pooley :—

"The membership of the club shall be confined to amateurs only.

"No member shall be eligible for membership or shall remain a member who accepts or has accepted any monetary benefit or consideration or the equivalent from a person or firm trading in the manufacture of motors or accessories thereof, or who shall have secured possession of a motor vehicle or accessories from such trading person or persons at a price or on terms which may, in the judgment of the committee, represent the equivalent of such consideration. The committee is entitled to demand the production of receipt or other satisfactory evidence in demonstration of this qualification.

"Membership is prohibited to those who are engaged or employed in the manufacture, sale, exhibition or exploitation of motoring goods or accessories.

"No member shall willingly or knowingly permit his name to be used in connection with the advertisement of motoring goods or accessories.

"Members competing in competitions organised by this club shall use only machines and accessories which are their own bona fide property, or are similarly owned by another member of the club.

"No member shall accept any cash prize for any motoring achievement or service, whether in competition or otherwise. He may, however, accept from the donor a prize in kind in lieu of the cash prize should such alternative be proffered. No member shall during his membership convert into cash any prize gained in motor cycling competitions."—Ed.]

Sir,—I am pleased to see in *The Motor Cycle* that the question of an amateur's T.T. race has at last been taken up. I am sure an event of this nature would meet with a large measure of success. If a course could not be found in England, what is the matter with Brooklands for such an event; it would be better than no race at all. As to the difficulty of defining an amateur, could not special rules be made for this particular event?

An alternative proposition which I should like to make is that every London motor cycle club should enter an amateur team for such an event.

Other opinions on the subject would no doubt be of value.

London, W.2. COMPETITION RIDER.

Sir,—With reference to your leading article headed "An Amateur T.T.," I would like to direct the attention of aspiring T.T. riders to the 100 mile Welsh T.T. race held at Pendine Sands on Whit Monday each year. The course is known generally as the finest natural speedway in Great Britain, it being possible to get a five miles straight stretch with return bends either end of 10/15 yards, making a lap of 10 miles. It provides a good sporting course, which tests the rider and machine, and gives a chance to ordinary riders who do not own specially faked 'buses.

I extend a hearty invitation to any aspiring T.T. winner to participate in this now classic event. The necessary qualifications are :—The machine must be of the "same as you can buy" variety, be privately owned, and the competitors must be members of some club in the South-West Wales Centre. H. G. CHURCH.

Secretary, South-West Wales Centre, A.C.U.

Sir,—I read with considerable interest your Editorial on a T.T. race for amateurs, especially as the Southport Automobile Club proposes holding a 50 or 100 mile race for amateurs on their own private machines, to be held on the Southport beach some time in the spring. It is possible to lay out a course of about five miles to the lap.

Any suggestions or comments from your readers will be welcomed. H. F. BROCKBANK.

## *UTTERLY AMAZING SPEEDS.*

Sir,—Your columns have lately contained correspondence concerning the real or visionary speed attainments of many motor cyclists, but I venture to think that none have so far traded upon the credulity of your 120,000 readers to the extent that the author of the following extract from a 1922 American catalogue attempts to do.

This is what it says : "An impressive endurance demonstration of the *de luxe* model was staged by A for the B field police. A straightaway run from B to the mountains was selected, thirty-two miles, up a grade varying from 2% to 14%. The trial was made on the hottest day of the year, and the route was across the desert. *A covered the distance with ease at above 65 m.p.h. average*, and at the finish the B police examined his motor carefully, paying particular attention to the cylinders, *which could be touched without discomfort*. Indeed, cool running is a striking feature of this new mount, for, after B had made a ten-mile run on A speedway with wide-open throttle, the cylinders were comparatively cool, and *could be touched with the bare hand*."

One presumes that the bare hand was enclosed in an asbestos glove, and in the first little jaunt up the mountain that the machine (well known in this country) was attached to a balloon of some sort.

However, it is a wonderful story.

London, W.2. TOMASO DUBITANS.

Sir,—I read with interest "Old Un's" statement *re* covering the distance between two milestones in fifty seconds on his pre-war Triumph. In the course of a recent reliability run, I covered the distance between two milestones in about one second. Both milestones bore the same inscription, the distances being identical, and they were about fifteen yards apart, one having been set up at a much later date than the other. WELLERSSET.

Sheffield.

## *T.T. OR LONDON-EDINBURGH.*

Sir,—"A. V. Smith's" letter in your issue of January 5th having come to my notice, I cannot let it go unchallenged.

After all, the London-Edinburgh is a holiday event, and

if the T.T. cannot be postponed, why change the date of the London-Edinburgh, when the majority of the competitors are free from business that week-end? I think we can safely say that the T.T. is purely a trade event, and what matters if a few of the "pros" cannot return to town in time for the "Edinburgh"? Regarding his remarks about other road users, does not the same apply in the island, and in fact in any competition?

Huddersfield. W.5420.

### *LICENCE HUNTING ADVENTURES.*

Sir,—Your correspondent "Allon" is not the only one who is finding trouble to renew his licence. I called at G.P.O. in my town (Kidderminster) for a renewal of my licence. They informed me that they had no licences and would not have any for three days. They also informed me that I could not renew my licence there, as I should have to take a licence out in the town where the machine was registered. I have written three letters to the authorities where the machine is registered, a fortnight has elapsed, and have had no reply. E. GRIFFIN.

Sir,—When first taking out a licence I was told to take it out in the district where the machine was usually kept, this being Surrey. I took it out in that county, but when renewing it this year, and sending 30s. to Kingston, I am told to take it out in the district where I reside, so the 30s. goes to London County Hall. Back comes the licence, but registration book is not returned. Applying for it, I am told to send particulars of index number and letter, although of course name and address are on it. This was some time ago, but I have not heard any more, so of course I could not, if I wished, sell my bicycle, as I have no evidence that it is mine. F. PENNINGTON.

### *REVIVAL OF AUTOMATIC INLET VALVES.*

Sir,—*Re* "H. Le Fe's" rash suggestions, when a boy at school I read a funny story about a fox without a tail. If Mr. Le Fe is still impecuniously restricted to a.i.v. models of the year dot, I think he ought to try his propaganda on the local club novices first, and not rush into the columns of *The Motor Cycle*, where riding experts and keen technical students (to say nothing of the trade) lie in wait to tear him up.

I don't want to be unkind, and I don't criticise your sense of humour in publishing his letter, but only the lack of that sense on the part of those who took him seriously while *The Motor Cycle* smiled up its sleeve. C. W. F.

P.S.—Why not do away with inlet valves altogether? I have!

P.P.S.—I ride an O.K.-Villiers.

### *TOWING A CARAVAN.*

Sir,—I notice in *The Motor Cycle* that Mr. Weatherill made and towed behind accommodation for camping out. This looks more comfortable than anything else that I know of, but in his list of expenses no mention is made of extra taxation. In *The Autocar* I notice that a tax of £2 is named for towing a two-wheeler. ("Query and Reply," No. 6583.) JOHN HARRIS.

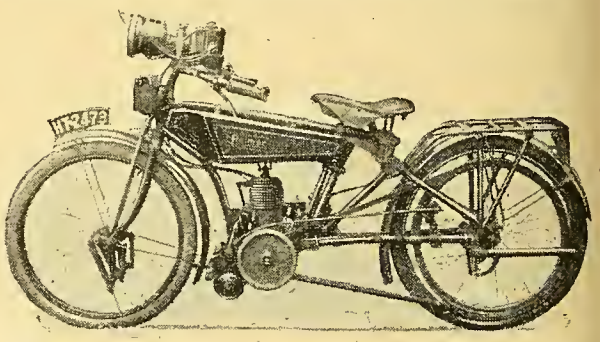
### *WHERE ARE THE SPRING FRAMES?*

Sir,—"Ixion," as well as others, is, I notice, still insisting upon the necessity for mechanically and experimentally efficient suspension for motor cycles. Apparently one particular make of spring frame is still unknown to these gentlemen, or they would be aware that the problem presented (and, confessedly, it *is* a problem when questions of additional weight, costliness, and really efficient service are all taken into account) has been successfully solved.

My machine (a 2¾ h.p. lightweight) has been *converted* to incorporate the Palmer patent rear suspension, and I can say with absolute truthfulness that no rider, young or old, of this type will have any cause whatever to complain of backache, even with roads in the condition they are to-day, or to take periodical rests upon long journeys to fortify physical powers of endurance against the shocks and sufferings of the next twenty-five miles or so.

The special points of interest to me about the Palmer type are that with it one gets *lateral rigidity* equal to that of a normal frame, quite ample spring movement to give the desired comfort whether on tolerably bad or very bad surfaces (this is absent from many types of spring frames), no unsightly or otherwise objectionably obtrusive parts, and practically nothing that can be disorganised by wear. The whole thing is simplicity itself, and I should think that the added manufacturing costs must be quite negligible, while the added extra weight of the complete machine is decidedly so.

Thinking it may be of interest to many of your readers to see how this type of suspension plans out in the *tout*



"Comfybus's" lightweight, which has been converted to a spring frame mount by means of the Palmer rear suspension set

*ensemble* of my converted mount, I enclose a photograph, from which it will, incidentally, be noticed that I do not derive much of my comfort from the front fork springing.

I have absolutely no connection with the patentee and maker of this frame, but think it only friendly towards brother motor cyclists to let them know that for one, at any rate, of the fraternity, back-aches are things of the past.

Radstock. COMFYBUS.

### *UNDER-SIZE TYRES AS PUNCTURE PREVENTERS!*

Sir,—I have often noticed remarks about fitting oversize tyres being a puncture preventative. I do not want to try and disprove these statements. I only want to know why, and should be very glad if some of your readers could explain how it is that a tyre which obviously covers a larger area of flints, etc., than a smaller one should be more unlikely to puncture than one which has a narrower track.

Once I am convinced, I shall fit these ideal covers.

Boston, Lincs. J. PONDERING.

[Since the oversize tyre usually has a proportionately *thicker* tread, it offers greater resistance to puncturing agents, and since it also has a *wider* contact area with the road the weight and strain of the machine are not concentrated on an unduly narrow strip.—ED.]

### *SENSITIVE SUPER SPORTING MOUNTS.*

Sir,—I was very interested in your report of the new four-valve Triumph, and "Harmony's" letter on his "super sports" Sunbeam. Might I add a word or two on behalf of what I consider the best super sporting solo mount in the world?

I refer, of course, to the 79×100 mm. T.T. Norton. I have had one of these models since April, and have covered a considerable mileage at high speed. I find that my engine is very sensitive to the ignition timing, but even more so to the mixture. My machine will start from cold in under ten yards, with a Philipson pulley top gear, 4⅝ to 1, with the air lever in a suitable position, but if the veriest shade more is given, the result is—no start!

There seems to be an idea among most motor cyclists that all multi-gears chew the belt up terribly. I am using a round-top Dunlop, which is splendid; the flat-topped belt supplied by the makers breaking at 800 miles. I carry it now as a spare.

I prefer the cast iron piston, as, owing to its being drilled considerably, it is very light and not so subject to variations of temperature as the aluminium model, which wears rather quickly compared with the cast iron one.

A. O. RUSSELL.

### EXPERIENCES WITH A SIMPLE FOUR-WHEELER.

Sir,—I have lately noticed several queries in your columns regarding the behaviour of the A.V. monocar, and thought that perhaps my experience with this very fine little 'bus, published in your journal, might be of interest and help to all concerned.

Last Autumn I completed a holiday tour from Manchester through Cornwall and Devon, having covered a shade under 1,300 miles in ten days' running, and that without a single involuntary stop, and for the majority of the time with a passenger on the dickey seat. We both travelled in comfort, and I could easily touch 40 m.p.h. on half throttle. One little jaunt from Penzance to Newquay, a distance of forty miles, and strange roads to me, was covered comfortably under an hour and a half, including a short stop to get on the right road again after missing the turn in Mitchell. I carefully checked my petrol consumption on the run down from Manchester to Penzance, and found it to be 57 m.p.g., during which run we climbed Porlock, Lynton, Barbrook, Parracombe, etc. Oil consumption I have not checked, for with that (Castrol C) I am generous. I have not yet been passed by anything on a main road, except when I was pottering along from choice. Its brakes are really excellent (though a bit jerky in application when new), and the tyres have stood up wonderfully well, and so far I have not used my pump on any of them. I do not know what overheating is, for, though the engine certainly gets hot, it does not in the least seem distressed, as my tour proves, all the hills mentioned being taken "on the run." The A.V. is always willing, and acceleration is one of its strong points. Driving is very simple, particularly if one will steer with the left hand and control with the right. The light steering makes this possible, even on bad roads, if a good "lock-grip" is used. Personally, my grip is as follows: Thumb under the spoke, first finger over the spoke, and the remaining three fingers round the rim, and this grip was used by me throughout the tour without the slightest inconvenience.

My machine is a 1921 model, fitted with the latest 8-10 h.p. J.A.P. engine, the only alterations from standard being the fitting of F.E.W. valve attachments, Bowden extra air inlet, spark intensifiers, and Molla air-cooled plugs. Referring to the two last-named fitments, I would like to say how well pleased I am with them. Since they were installed I have not experienced a single misfire, nor a sooted or oily plug, though I am always liberal with lubrication. Also, I am sure they have a lot to do with easy starting.

In conclusion, I have nothing but praise for the little A.V.—a top gear 'bus which gives luxury in a simple manner—and can honestly recommend it. I am nothing more than a delighted owner, but must, I suppose, add the usual disclaimer. J.H.G.

Manchester.

### SIDECAR FUEL CONSUMPTION RECORDS.

Sir,—After reading the correspondence under this heading, my result in the recent London-Exeter run pales into nothing. Riding an 8 h.p. spring frame outfit registered as weighing "under eight hundredweights," I averaged exactly twenty miles to the hour and a shade over forty-nine miles to the gallon. DONALD S. PARSONS.

### CANDID CRITICISM OF A BRITISH BIG TWIN SIDECAR.

Sir,—Perhaps the following criticism of a 1921 Enfield sidecar outfit would prove of interest. The mileage covered is 1,250, and I have endeavoured to be as fair as possible. Perhaps other private individuals would supply information of their new mounts for comparison. Usual disclaimer.

Tyres.—Very good. Three punctures, all nails.

Cycle Parts.—Very strong. No trouble whatever.

Mudguarding.—Front, excellent. The back guard splashes the rider's back in really wet weather.

Springing.—Good on the whole. Bad roads have broken ball in the steering head.

Silence.—All that can be desired. Talk comfortably to passenger up to 25 m.p.h. When ticking over in traffic the engine note is barely perceptible.

Speed.—With three up, 43 m.p.h. on the level with no wind; 30 m.p.h. in low gear with two up.

Oil Consumption.—On the heavy side, which makes the engine liable to smoke when hot and running dead slow.

Oil Pump.—Excellent. No trouble.

Petrol Consumption.—Averages 55 m.p.g. at 22 m.p.h. average. Have done 65 m.p.g., three up. I use a W.S.R. variable jet.

Engine.—Very powerful. Climbs practically anything on top with two up. Very seldom change with three up.

Gear.—Delightfully simple. Changed the cam face once, and replaced one peg.

Chains.—Front ones in perfect condition, and run in oil. The back is cleaned whenever wet or after each 250 miles.

Chain Adjustment.—Back very simple. The front untouched as yet.

General Accessibility.—The detachable rear mudguard and carrier makes punctures in the back wheel of no great importance. Mended in 15m. easily. The sidecar jack is simple and easy to operate. Accessibility of the rear chain is a great point.

Brakes.—The back is easily adjustable and powerful; stops machine dead with three up. The front brake will not adjust too easily, but is powerful.

Lucas Lighting Set.—Faultless. Have burnt out the dim filament of one head lamp bulb.

Apollo Electric Horn.—Fitted by myself. Very efficient; no trouble.

Sidecar.—Very comfortable; but does not adapt itself much to fitting proprietary windscreens. Bluemel fitted gives good results, but awkward getting in and out unless undone, when it folds back out of the way.

Luggage Grid.—Exactly holds two suit cases, which are perfectly secure and sprung with the body of the sidecar. I have carried a case of lemonade a short distance without breakage.

Sidecar Box.—Holds spare gallon of petrol and tools, and spare oil (one quart), which is very handy.

Petrol Tank.—Holds two gallons, but spills over the filler cup.

Handle Starter.—I prefer a kick; but it is all right once the knack has been learnt.

Plugs (Lodge Waterproof).—Cleaned the back one once. No misfires on the road.

Carburetter (Amac).—Does not give terrific acceleration, but is a good all-round fitment.

Transmission Shock Absorbers.—Faultless.

General Reliability.—One involuntary stop in 1,250 miles. The front chain came undone. Spring link replaced in half an hour. Otherwise the outfit runs like a train.

Edinburgh. 3485.

### SUMMARY OF CORRESPONDENCE.

Writing "as one of the old brigade," Mr. H. Siddall comments on the absence of the 5-6 h.p. Raleigh and sidecar from the important competitions of last year.

Referring to Mr. Maynard's recent letter offering to race "Old Un's" 72 m.p.h. Triumph, Mr. E. Wilkinson wishes to accept the Zenith owner's challenge with his 3½ h.p. Rudge.

## Books & Maps for Motor Cyclists.

Issued in conjunction with *The Motor Cycle*.

**"MOTOR CYCLES AND HOW TO MANAGE THEM."**
The standard handbook on the motor cycle.
Price net, 2/6. By post, 2/10.

**"HINTS AND TIPS FOR MOTOR CYCLISTS."**
New Edition. Just Published. Price net, 2/-. By post, 2/3.

**"TRACING MOTOR CYCLE TROUBLES."**
A system for tracing motor cycle faults and of remedying them when found. Fourth Edition.
Price net, 2/-. By post, 2/3.

**"TWO-STROKE MOTOR CYCLES."**
A reliable treatise on Two-strokes, from the rider's point of view. Price net, 3/-. By post, 3/3.

**"MOTOR CYCLE REMINISCENCES."**
By "Ixion," of *The Motor Cycle*.

**"THE MOTOR CYCLE" ROAD MAPS.**
**Set of Three Maps—England and Wales, Scotland, London.** Set of three, complete in case. Price net, 5/6. Book post, 5/10. **Set of Two Maps—England and Wales, London.** Price net, 4/6. By post, 4/8.

**"THE MOTOR CYCLE" ROUTE BOOK.**
With 32 pages of Road Maps. Price net, 5/-. By post, 5/4.

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., Dorset House, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.

# MOTOR CYCLES AT THE SCOTTISH SHOW.

## Machines on Exhibition at Kelvin Hall, Glasgow, arranged alphabetically. A Guide to Intending Visitors.

TO-MORROW (Friday, January 27th) the Scottish Motor Show opens at Kelvin Hall, Glasgow. Although this is not the first time motor cycles have been exhibited at a Scottish Show, it is the first Scottish Show officially recognised by motor cycle manufacturers. Hitherto, well-known Scottish agents have exhibited the products of the makers they represent, but on the present occasion this class of exhibitor is supported by no fewer than twenty exhibits staged by manufacturers themselves.

This is a wise decision, as so many Scottish riders are unable to undertake the long journey to Olympia in November, and, although the number of models on view is not much more than 50% of those exhibited at the big Show in London, it is sufficiently representative to enable Northern riders and buyers of motor cycles to obtain necessary information regarding modern design.

In the following pages we illustrate and describe the motor cycles represented at Kelvin Hall. They are arranged alphabetically for the convenience of those who intend to visit the Show.

**ALLON.** **Stand 198.**

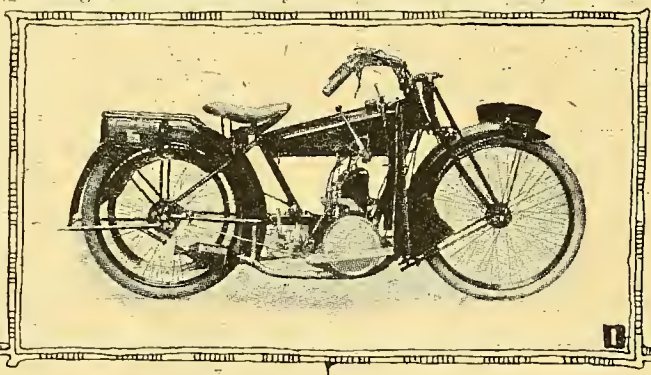
One example only of the Allon lightweight will be shown (on the stand of Rossleigh, Ltd., Edinburgh). Priced at £60, it is a standard conventional type two-speed chain-cum-belt lightweight with a 70×76 mm. (292 c.c.) two-stroke engine of Allon design. The cylinder is cast with the top half of the crankcase; a flywheel magneto is fitted. Perhaps the most distinctive feature at a first glance is the capacious saddle tank, which, however, does not appear in any way unwieldy or out of proportion. The primary chain is neatly enclosed and, of course, a clutch and kick-starter are incorporated. Leg shields have long been standard on this machine, and it may be taken for granted that the makers have so designed them that they do not interfere with the cooling. The mudguarding, too, is well carried out.

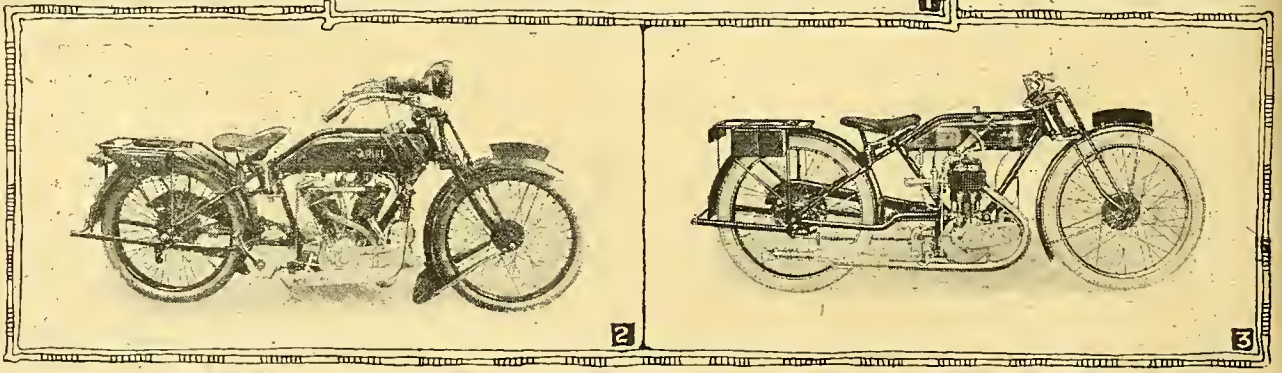
**ARIEL.** **Stand 197.**

Perhaps the most important new type of Ariel is the £87 10s. sports model, which is fitted with a 498 c.c. engine and a countershaft three-speed gear box, final drive being by belt. In order to allow a thoroughly reliable and well-finished machine to sell at this low figure several luxury fitments have been omitted, including the kick-starter and spring seat pillar. The more fully equipped touring model with the same size engine, nominally 3½ h.p., is also staged at £95. Three sidecar outfits will be on view: the 4½ h.p. (665 c.c.) single cylinder, £140; the 6-7 h.p. (796 c.c.) twin, £152 10s.; and the 8 h.p. (994 c.c. M.A.G.) twin, £183. All have chain drive, and the last mentioned is equipped with a Lucas Magdyno lighting set and a sidecar hood. 28×3in. tyres are standard on the sidecar machines. The Ariel is also exhibited by Andrew Downie, Ltd., of Edinburgh (Stand 199).

**A.J.S.** **Stand 208.**

In addition to its successes in international events—both T.T. races, etc.—the 2¾ h.p. A.J.S. has distinguished itself in Northern competitions, and there is no doubt that the three production solo models and the lightweight sidecar outfit will command much attention. These most attractive £85 models differ mainly in detail: the touring model has full mudguarding and footboards, the standard sporting has footrests, and the stripped sports machine, as the name implies, is minus touring equipment, includ-





(1) 2¾ h.p. two-stroke Allon. (2) 8 h.p. Ariel with M.A.G. engine. (3) 2¾ h.p. stripped sports Model A.J.S.

ing kick-starter. With a light sidecar the fully mudguarded model sells at £110. Fairly extensive chain guards are fitted in every case, except to the "stripped" type. Also shown will be two examples of the equally popular and successful 7 h.p. sidecar outfit, one with Magdyno, spare wheel, speedometer, and sidescreen, at £218 12s. 6d., the other *sans* these extras at £175. A.J.S. machines will also be found on the stands of Andrew Downie, Ltd. (199), Meldrums (204), Bell Bros. (207), and Chas. Middleton and Son, Ltd. (194).

**BEARDMORE—PRECISION.** **Stand 184.**

Scottish motor cyclists, and particularly those who reside in Glasgow, know and respect the name of Beardmore. Allied with another well-known Glasgow firm, Barr and Stroud, the resulting product will inevitably attract much attention. But the lightweight Beardmore with the sleeve valve Barr and Stroud engine is not the only exhibit of interest on this stand. The new 4¼ h.p. (600 c.c.) Beardmore-Precision with "semi-unit" engine and gear construction, will be staged. Its price solo is £105, and with sidecar £135 for the touring type and £130 for the sporting model. Finally, there will be solo and sidecar examples, at £75 and £105 respectively, of the 350 c.c. Beardmore-Precision two-stroke. In this case a two-speed gear box is fitted, and the final drive of the solo machine is by belt.

In addition to the exhibit of its makers, Messrs. F. E. Baker, Ltd., the Beardmore-Precision will be exhibited by no fewer than three other firms—Alexander's (178), James Robertson's (190), and Charles Middleton and Son (194).

**BRADBURY.** **Stand 210.**

Only one Bradbury model will be shown. V. Jennings and Co., Ltd., Glasgow, will stage a 4 h.p. machine, without sidecar (although this type is eminently suited to passenger work). This Oldham make has been on the market for a great many years now, but it has moved with the times, and although the old method of casting the crankcase integrally with the frame is retained, all-chain drive, a three-speed countershaft gear, and an internal expanding rear brake are included in the specification of the 1922 version. The single-cylinder engine is of 89×89 mm. (554 c.c.) and, excepting its cast iron crankcase follows fairly conventional and well-tried lines. Solo, the machine is priced at £92.

The Bradbury Co. has recently introduced a new 8 h.p. twin-cylindered sidecar outfit, which, with the well-known 6 h.p. twin and 2¾ h.p. solo model, makes the Bradbury range complete for almost every class of buyer.

**BROUGH.** **Stand 177.**

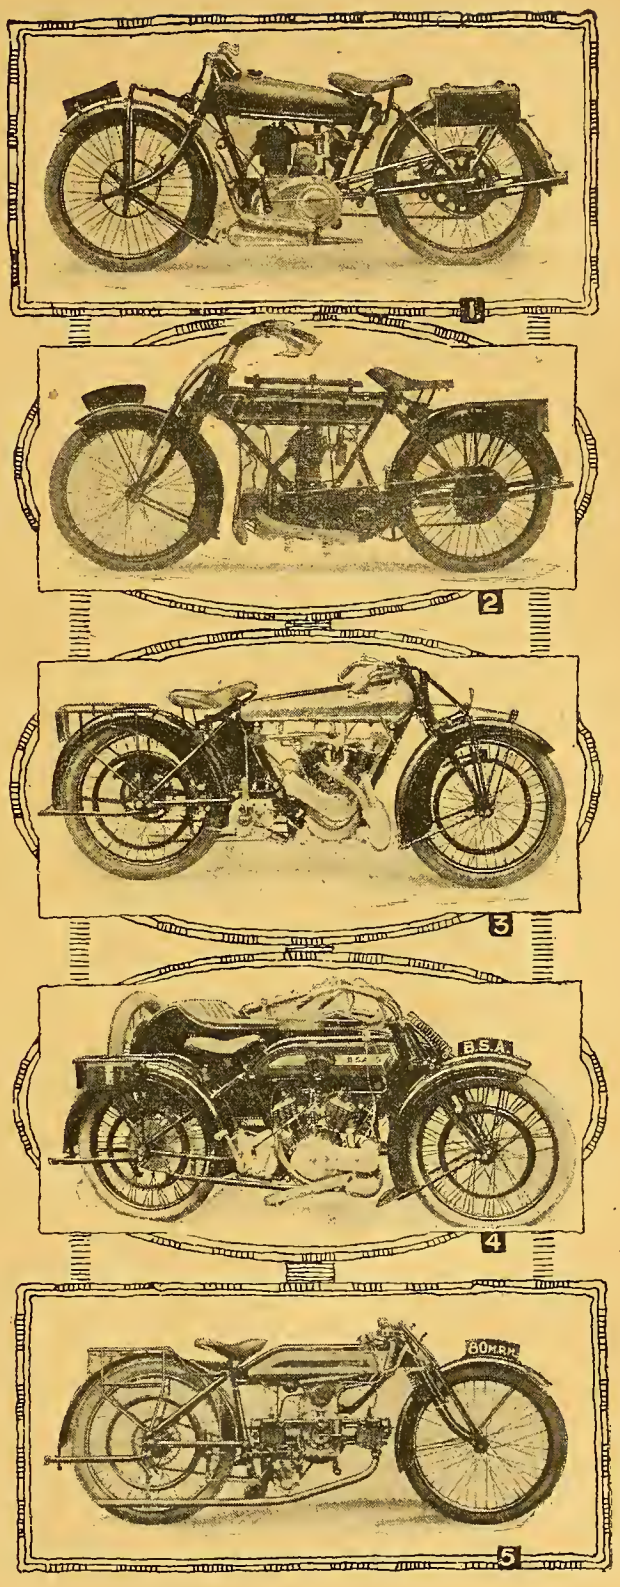
Because the Brough was an absentee from the last Olympia Show, its presence in the Kelvin Hall gains added interest. An old-established machine of Nottingham origin, it has achieved some noteworthy performances in past Scottish Trials, once completing the course single-geared. The introduction of an 80 m.p.h. speed model is the chief innovation for 1922. This is a flat twin with short wheelbase. Overhead valves are used and light reciprocating parts generally. Transmission is by chain throughout, a close ratio Sturmey-Archer gear box, less kick-starter, being fitted. A carrier is optional, and in its simplest form this model is remarkable for its exceptionally light overall weight. Its price is £115.

The larger 5 h.p. machine is intended mainly for sidecar haulage.

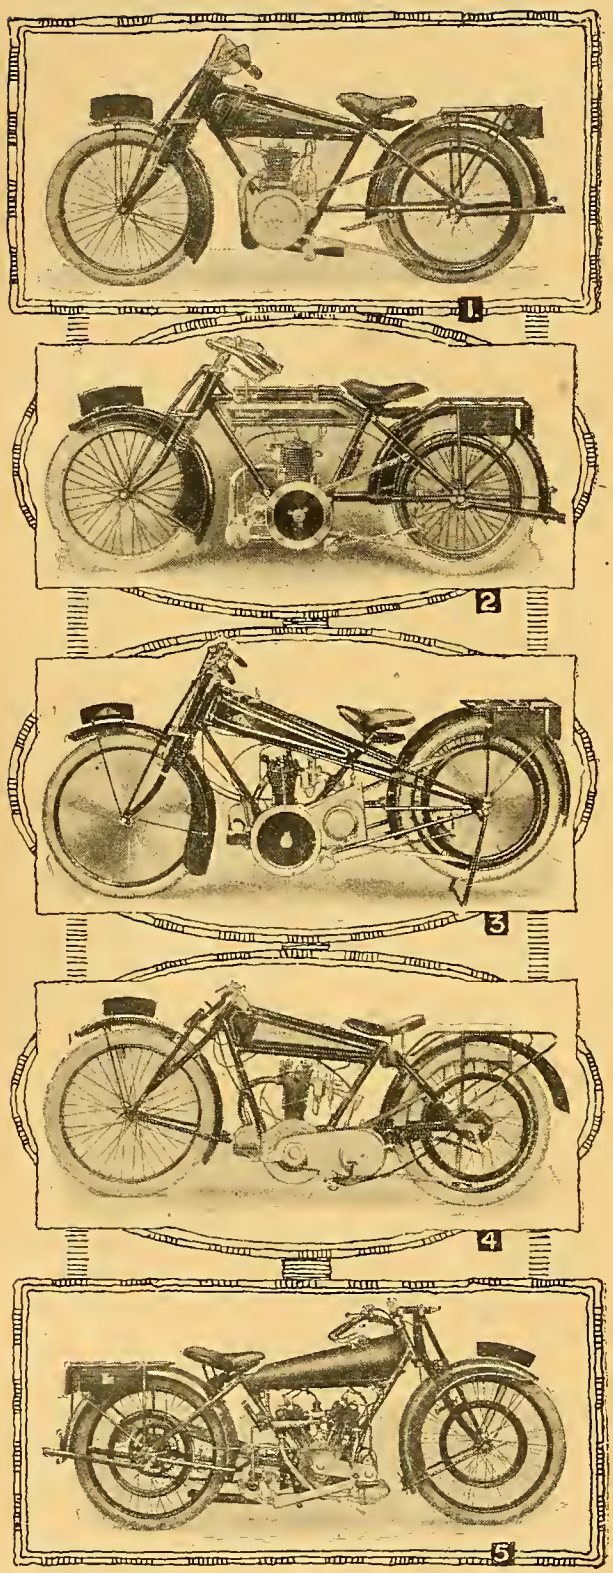
**BROUGH SUPERIOR.** **Stand 177.**

In a very short space of time the Brough Superior has climbed to a high position in the esteem of the motor cyclist who wants speed and luxury combined in the one machine. Recognising that only a big twin engine may reasonably be expected to propel a mount embodying these two qualities, the designer of the Brough Superior has aimed at controllability and handsome appearance more than reduction in weight.

Three types, differing mainly in power unit, are now available—one fitted with a 6-7 h.p. M.A.G. engine and the other two with 8 h.p. J.A.P.s with side-by-side and overhead valves respectively. Although first intended as a super solo machine, it is now marketed, in all three models, as a luxurious but sporting passenger outfit.



(1) 4¼ h.p. spring frame Beardmore-Precision. (2) 4 h.p. Bradbury. (3) 6-7 h.p. Brough Superior, with M.A.G. engine. (4) "Light Six" B.S.A. Outfit. (5) 3½ h.p. o.h.v. flat twin Brough.



(1) 2½ h.p. two-stroke Calthorpe. (2) 2½ h.p. Connaught Miniature which has 24 in. wheels and direct belt drive. (3) 2¾ h.p. Cotton-Blackburne. (4) 2¾ h.p. o.h.v. spring frame Coulson. (5) 5 h.p. Coventry Eagle.

## B.S.A. — Stands 198 and 207.

The B.S.A. is one of the three makes popularly reputed to be seen most often on the roads of Scotland, and it is not surprising that the green and grey tanks will be dotted all over the Kelvin Hall. Bell Bros., Glasgow, and Rossleigh, Ltd., Edinburgh, are two of the chief exhibitors. The range extends from a 4¼ h.p. single-cylinder sports model—a 1922 innovation with a kick-starter and enclosed chains—to the new 8 h.p. (985 c.c.) twin sidecar outfit. In between are the "light six" (770 c.c.) outfit and the 4¼ h.p. dual-purpose touring machine (belt or chain-driven). Prices extend from £107 to £185. B.S.A.'s are also staged by Alexander's (178), Middleton's (194), and Harry Gold (202).

## CALTHORPE. — Stand 192.

Two-stroke and four-stroke Calthorpes will be displayed by the North British Machine Co., Ltd., of Glasgow. Both are purely solo mounts with a simple and inexpensive specification, and the prices are moderate. Single-geared, the 247 c.c. two-stroke, which has 24in. wheels, is only £36; a two-speed box is £8 extra, £9 with clutch, and £11 with kick-starter in addition. Lubrication of the engine is carried out by leading the oil by way of sight drip feed to a groove encircling the cylinder walls.

A 292 c.c. J.A.P.-engined four-stroke with an Enfield two-speed gear is priced at £65, or with kick-starter at £70. 26×2in. tyres are standard on this model.

## CARLTON. — Stand 192.

Made and exhibited by the North British Machine Co., of Glasgow, this little lightweight will no doubt attract attention from those who favour "home productions." A neat mount selling at £39 18s., single-geared, it has a sloping top tube, 26×2¼in. tyres, and a Villiers two-stroke engine with flywheel magneto. With two-speed, clutch, and kick-starter the price is £53.

## CONNAUGHT. — Stand 212.

Among the pioneers of the lightweight two-stroke, the makers of the Connaught continue to specialise on this type. At the same time, sidecar successes in competition have encouraged them to market a slightly increased capacity model (82×70 mm., 370 c.c.) primarily intended as a lightweight passenger outfit. All chain drive and a three-speed gear box are appropriate items on the specification. Naturally, it makes a useful little solo mount of the go-anywhere type.

Also staged will be three 1922 examples of the original 2½ h.p. Connaught miniature, one with 24in. wheels and direct belt drive, another with 26in. wheels and a two-speed gear box, and a third the same but with clutch and kick-starter.

## COTTON. — Stand 202.

For some time obtainable only as a two-stroke machine, the triangulated frame Cotton blossomed out as a four-stroke at the last Olympia Show, when a 2¾ h.p. Blackburne-engined model made its debut. One of this new type will be staged by Harry Gold, Glasgow. It is an attractive machine in appearance, and, in addition to the theoretical advantages of its straight-tube frame construction, it possesses an unusually low centre of gravity. This latter feature, combined with the absence of whip of the frame and maintenance of wheel alignment, helps to eliminate any tendency towards skidding on the road. Chain and belt transmission is employed and a two-speed Sturmey-Archer gear box with clutch and kick-starter on the standard model, which sells at £65 2s.

## COVENTRY EAGLE. — Stand 214.

Six actual machines will be shown as representatives of a very wide range of models indeed. In every case the now familiar bull-nosed saddle tank lends a most attractive air of distinction to the Coventry Eagle machines, although proprietary engines are used throughout. The o.h.v. 250 c.c. "luxury" lightweight calls for special mention; this particular type of J.A.P. engine is at present made exclusively for this model, and finned exhaust manifolds are among its novel features of design. Transmission is by chain through a two-speed Sturmey gear box. Aluminium number plates, lamps, and even mascot are included in the price of £105.

Another model, of particular interest to the soloist, is the 500 c.c. J.A.P.-engined sports mount, which is fitted with aluminium pistons and the usual "competition machine" modifications. With a three-speed Sturmey gear box and final chain drive the price is £110.

Sidecarists are catered for by the 500 c.c. single and the 680 c.c. twin outfits at £135 and £150 respectively. 293 c.c. J.A.P. and 269 Villiers-engined lightweights with chain-cum-belt drive are listed at competitive prices, varying according to specification, and also a 350 c.c. J.A.P.-engined utility machine sold "all-on" at £88 10s.

**COULSON.** **Stand 202.**

With an o.h.v. 2¾ h.p. Blackburne engine in a neat spring frame, the T. T. Coulson promises possibilities of speed and comfort cleverly combined in suitable proportions. All-chain drive through a close ratio Burman gear box, less clutch and kick starter, is employed, and the handlebars, footrest position, and such details are essentially those of a sporting machine. The price is £95, which is also the figure charged for the 4¼ h.p. side-valve Blackburne - engined touring A Sports sidecar attached to the latter costs £25 extra. Two and three-speed standard touring 2¾ h.p. machines are priced at £78 and £82 10s. respectively. Examples of these will be on the stand of Harry Gold, Glasgow.

**DIAMOND.**
**Stands 178 and 201.**

The Diamond is a Wolverhampton production, and its quality in every way upholds the reputation of that town, which boasts of its splendid motor cycles. For many years specialists in lightweights, its makers, the D.F.M. Manufacturing Co., offer four models: A 70 × 70 mm. two stroke, 70 × 90 mm., 70 × 76 mm., and 64 × 76 mm. four strokes. The last mentioned is one of the type developed by the 250 c.c. class in the Junior T.T. race and, with two-speed gear, clutch, and kick-starter, all-chain drive, sells at £78 15s. A Duplex frame, with detachable lower tank rail, is a feature of Diamond machines, while steel stampings are used wherever possible. The three-speed all-chain driven model has entirely enclosed chains and a 350 c.c. J.A.P. engine.

Examples of this range of machines are exhibited by Alexander's (178) and the D.R. Engineering Co., Dumfermline (201).

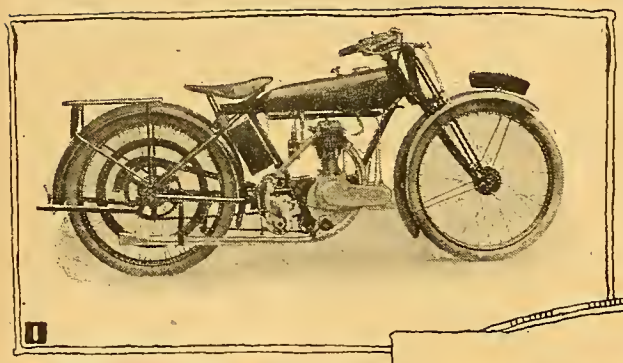
(1) 2¾ h.p. all-chain drive Diamond. (2) 3½ h.p. o.h.v. sports model Douglas. (3) 4 h.p. two-stroke Durelt outfit. (4) 6 h.p. Popular Model Excelsior sidecar. (5) 8 h.p. Enfield.

**DUNELT.** **Stand 186.**

As the only 500 c.c. air-cooled single-cylinder two-stroke, the Dunelt has been steadily gaining a reputation both for reliability and pulling capabilities since its introduction to the public about two years ago. Simplicity of design and concentration on one model allow the machine to be marketed at a very moderate price; the sidecar outfit with interchangeable (and spare) wheels is priced at £115 8s. A two-diameter piston and very flexible front forks are two of the Dunelt's outstanding features. Transmission is by chain and belt *via* a Sturmey Archer three-speed gear box, and 28 × 3in. tyres are standard. One solo, one tradesman's carrier, and two ordinary sidecar outfits will be displayed on this stand. An M.L. Maglita, speedometer and various like equipment is included in the specification of one of the latter exhibits. The makers, Dunford and Elliott (Sheffield), Ltd., are the exhibitors.

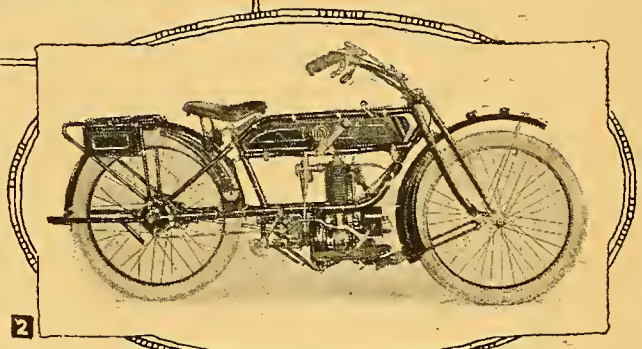
**DOUGLAS.** **Stand 179.**

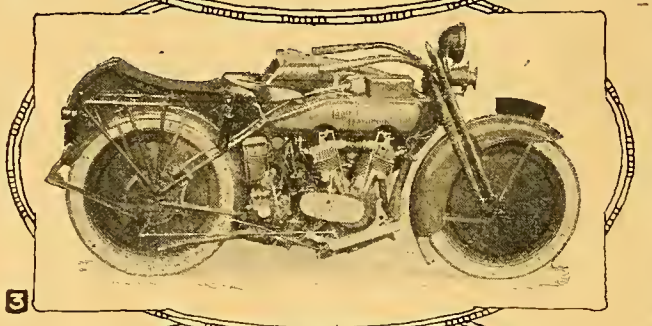
Although only five models of the Douglas will be exhibited by the Douglas firm, they represent a very varied range, catering for solo and sidecar tourist or speedman. Probably most attention will concentrate on the sidecar models: the re-designed edition of the war-tried "four" and the new o.h.v. 6 h.p. sports outfits, said to be capable of over 60 m.p.h. with a full-sized passenger in the comfortable sidecar. The former, of course, makes quite an appreciable appeal as a solo mount (£110), although it will have a difficult task to displace the extremely familiar 348 c.c. model in either its plain two-speed or three-speed clutch and kick-starter guises. The 2¾ h.p. types sell at £75 and £90 respectively and the 6 h.p. outfit at £165. Last, but not least, there is the record-holding and very successful 3½ h.p. o.h.v. sports model at £130. It seems superfluous to mention that all have flat twin engines of the type which the Douglas has done so much to popularise.

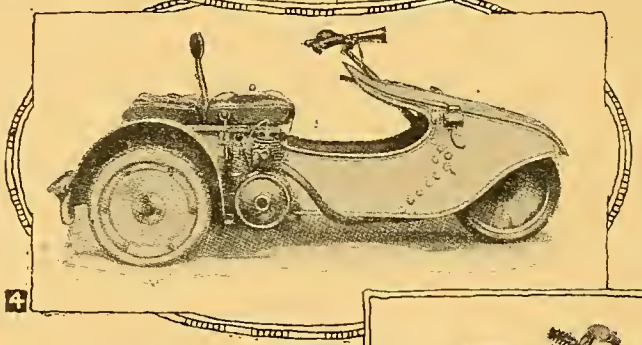


notable for excellent finish and neat appearance, differ considerably in purpose although the general specifications are not unlike. The smaller model is intended as a utility touring lightweight; it has final belt drive and, except when otherwise ordered, a two-speed gear box. A Maglita combined ignition and lighting set in this case increases the price from £73 to £88 9s.

Quite a different proposition is the 346 c.c. type, which has a Sturmey-Archer lightweight three-speed gear box and all chain drive. Several novel features are incorporated: for example the gear-lever quadrant is attached to a special bracket held by the gear box holding down the nuts; it thus moves with the gear box, the gear control needing no resetting when the primary chain is adjusted. £85 is the price; for an extra £5 it may be obtained specially tuned, with an aluminium piston, etc.







## ENFIELD. Stand 182.

The 8 h.p. Enfield sidecar outfit may be regarded as a very hardy survival of high power-weight ratio school of design; it depends for its hill climbing and flexibility in almost all normal running on the big engine's top gear pulliug capabilities. There being only two speeds, "low" must needs be an emergency gear. In practice the Enfield two-speed gear, which, of course, is of the expanding clutch type, is very simple and almost foolproof, and successes in important competitions prove that the machine is just as capable of freak hill-climbing as the majority of standard three-speed sidecar outfits. The engine is of Enfield design, but built by Vickers. Two examples will be exhibited by the Enfield Co., a standard outfit at £140 and the same model with a Magdyno set at £158. Sidecar hood and screen may be supplied at an extra charge of £8. Also a two-speed model, the Royal Enfield two-stroke, sells at £55, or £57 with kick-starter, which may be fitted at either side of the machine.

## EXCELSIOR. Stand 192.

Exhibited by the North British Machine Co., Glasgow, are two models of the Excelsior range—a solo and a sidecar machine. The first of these is a sporting mount fitted with a 2¾ h.p. Blackburne engine. It has a particularly neat frame, having a sloping top tube, and which provides a low riding position. With three-speed gear, clutch, and kick-starter, and very complete equipment, this machine is catalogued at £75.

The sidecar model is the smaller of the two twin outfits manufactured by the Excelsior firm. The engine fitted is a 6 h.p. J.A.P. (75×85 mm.=770 c.c.) and the machine throughout is of sturdy construction, having 28×3in. tyres, and an exceptionally large diameter steering head. The transmission is by chain throughout, and the equipment is in every way up to the work demanded from this type of passenger machine. With sidecar, the price is £133, Magdyno lighting being £22 10s. extra.

## FRANCIS-BARNETT. Stand 202.

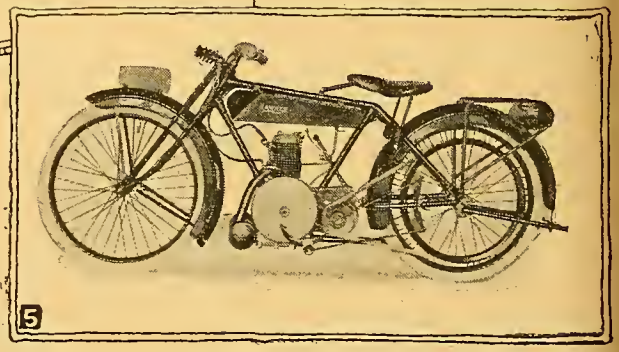
292 c.c. and 346 c.c. J.A.P.-engined Francis Barnett lightweights will be shown by Harry Gold. These machines, both

## F.N. Stand 213.

Dickens, Ltd., of Glasgow, are making an exclusive show of the Belgian-built F.N. machines, which as most motor cyclists know, are all shaft-driven and generally follow automobile practice to a greater extent than the average British design. This is particularly exemplified in the two four-cylinder models, rated at 7 and 8 h.p. respectively. The latter, a *de luxe* type, has overhead inlet valves centrally located in the cylinders, and is practically an entirely new design for 1922. Solo it costs £135; with sidecar £167. The prices of the 7 h.p. models are £95 solo and £127 sidecar. Two lightweights on the same lines—one with the new design of valve gear—are listed as 2½ h.p. and 3 h.p.. In this case two-speed gear boxes are used, but clutches and kick-starters are provided. Both weigh but 180lb., and are priced at £55 and £72 10s.

## HARLEY-DAVIDSON. Stand 209.

Harley-Davidsons will only be present (on the stand of the H.G. Motor Co., of Edin-



(1) 2¾ h.p. Francis Barnett. (2) 3 h.p. F.N. with shaft transmission. (3) 7-9 h.p. Harley-Davidson. (4) 2½ h.p. two-stroke Harper Runabout. (5) 2½ h.p. two-stroke Hawker with flywheel magneto.

# Like riding on air

**is the feeling you have when Moseley tyres are fitted to your machine. The outstanding characteristic of Moseley is supreme resiliency — Resiliency which absorbs the shocks of the road, lengthens the "life" of the machine, and gives unequalled comfort to the rider.**

**And the Moseley tread "bites" the skin of the surface—it does not merely slither over it—therefore no side slips.**

**In all sizes at lowest prices.**

**If you have not yet sent for your copy of the new season's price list, do so at once.**

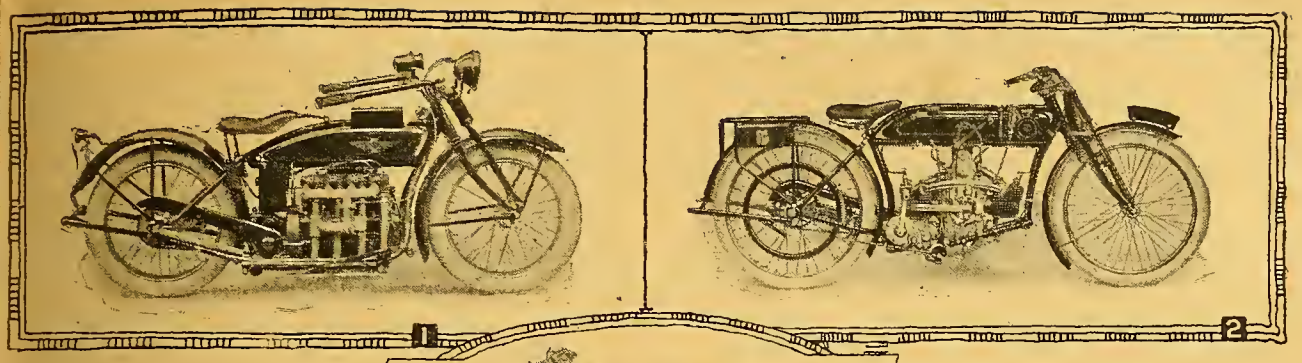
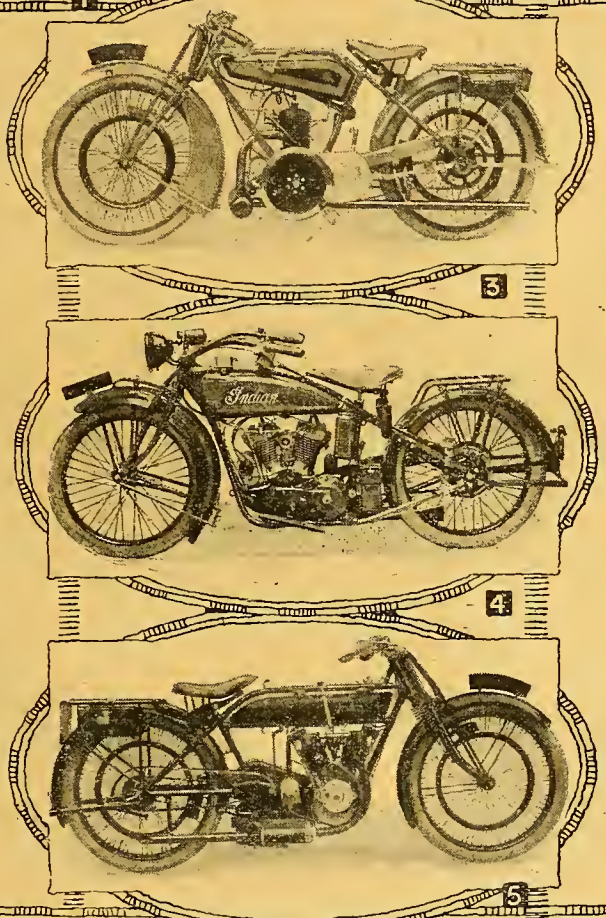
*(where demonstrations will be given without obligation.)*



burgh) in their big-twin form; the flat twin sports model will not be on view. Instead, there will be a very speedy looking example of the 7-9 h.p. twin as a road-racing solo machine. Two of the 1922 sidecar outfits (finished in the new dark green colour), one of a sporting and the other a touring type, and a third khaki-coloured outfit complete the exhibit. Capacious petrol tanks, large tyres, twist grip control, and such-like typically American but none the less admirable features are included in the specification. Taken all round, the Harley-Davidson combines serviceability with speed.

## HARPER RUNABOUT. Stand 230.

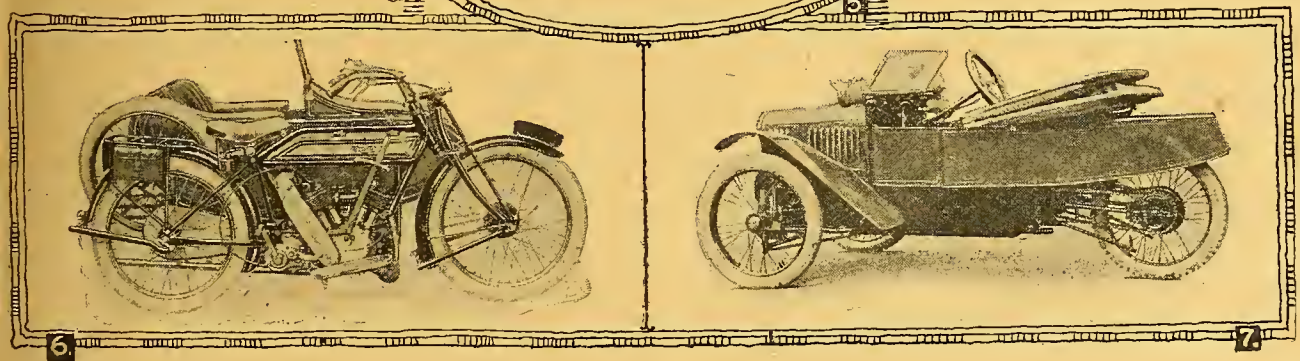
It is difficult to classify the Harper Runabout otherwise than by the name which its makers have given to it. The vehicle is a low-built three-wheeler, with the wheels arranged in the so-called tricycle fashion. Transmission from the modified Villiers two-stroke engine is by Renold's chains, and a simple type of gear gives three direct forward speeds, thus ensuring that no pushing will be necessary on all ordinary and some extraordinary hills.



Another point which should attract the elderly or lady motorist in particular is a hand starter; and, naturally, a clutch, of the single disc Ferodo-lined type is provided. The centre of gravity of the machine is extremely low; only direct comparison with a sidecar outfit really demonstrates this. 18×2¼in. straight-sided Dunlop Magnum tyres are mounted on detachable rims, and the pressed steel interchangeable wheels are also of Dunlop manufacture. Comfort and security are enhanced by quarter elliptic springing from the rear and two independent hand and foot operated brakes. Although a single seater, the Harper Runabout has proved capable of transporting an extra passenger on a special pillion seat. Three models are shown, all at £100.

## HAWKER. Stand 178.

The Hawker name was introduced to the motor-cycle world after the war, when it distinguished a simple two-stroke machine (equipped with a double-chain two-speed gear and a fly-wheel magneto) which at once commenced to give a good account of itself in competitions. At the last Olympia Show the Hawker range was extended by



(1) 10 h.p. four-cylinder Henderson. (2) 4½ h.p. flat twin Humber—a dual purpose mount. (3) 3 h.p. two-stroke Ivy. (4) 7-9 h.p. electrically equipped Indian Chief. (5) 5 h.p. Lea-Francis, fitted with o.h.i.v. M.A.G. engine. (6) 7 h.p. James sidecar. (7) 10 h.p. Sports Morgan, listed at a popular price.

models fitted with 2¾ h.p. and 4¼ h.p. Blackburne engines and three-speed gear boxes, with chain transmision. A 2¾ h.p. o.h.v. Blackburne engine is used in one type, the make-up of the machine being on particularly sporting lines. All the four-stroke models have internal expanding brakes on both wheels. The 2¾ h.p. o.h.v. machine costs £99 15s.; the 4¼ h.p. model is £89 5s.; and the 2¾ h.p. two-stroke is £52 10s.

## HENDERSON. Stand 177.

In the four-cylinder Henderson, Pioneer Motors, Ltd., of Edinburgh, probably stage the most elaborate machine in the building. A re-designed oversize engine in a modified frame tends to make this mount more than ever the ideal of the four-cylinder enthusiast, who is often content to ride it solo despite the inevitably great weight attendant on such a design. However, this latter objection is nullified by better controllability, more even torque, and remarkable flexibility. £175 is the price of the solo model. When used with a sidecar a reverse may be fitted. Quickly detachable wheels are now standard.

## HUMBER. Stand 176.

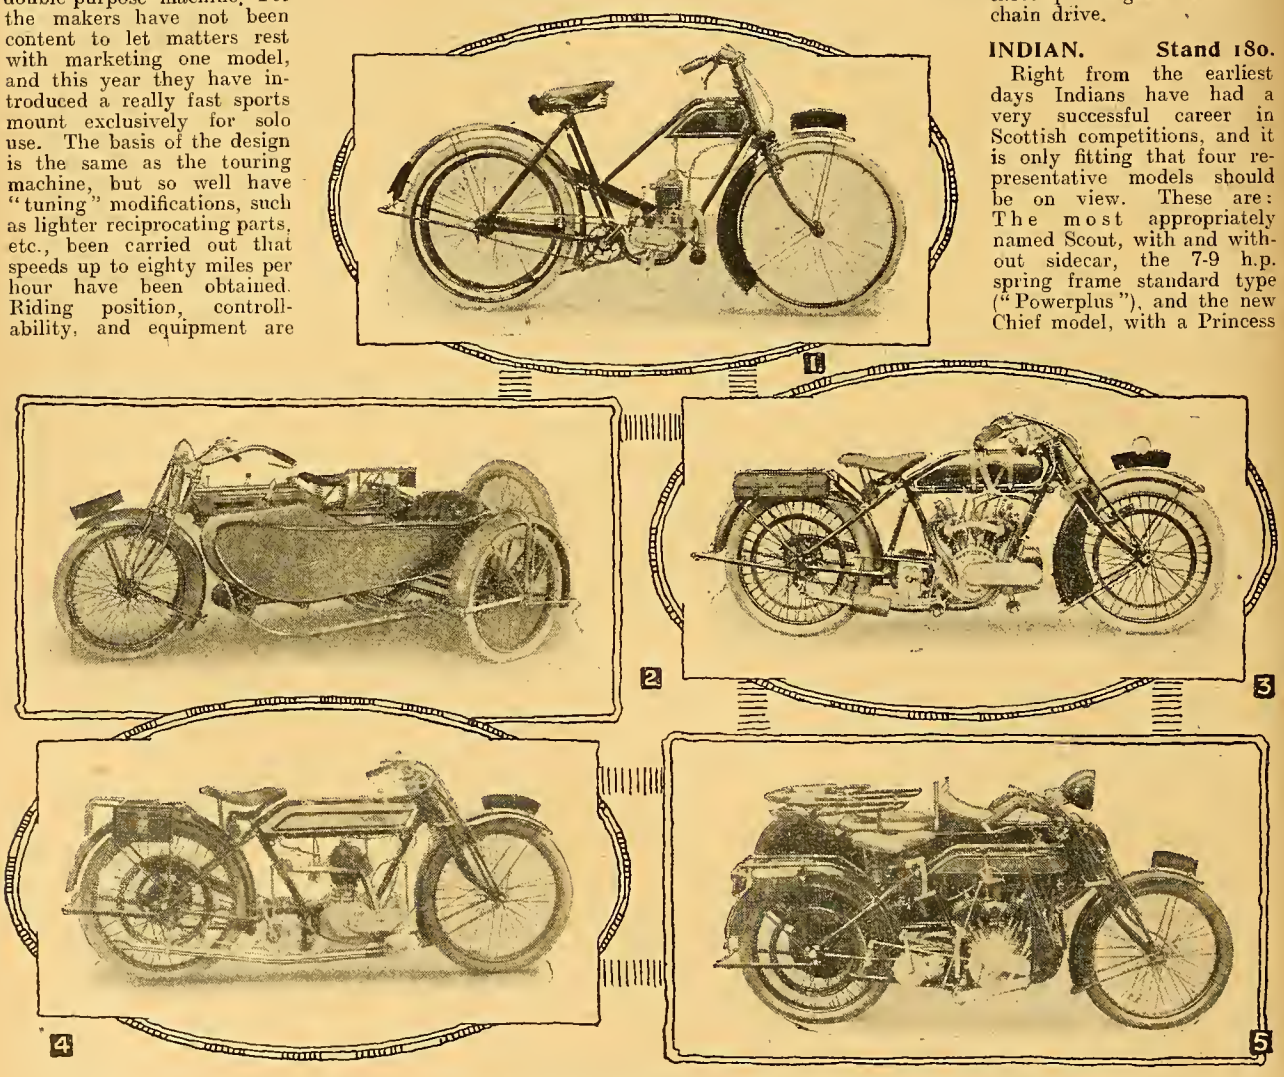
Although fitted with a comparatively large (600 c.c.) flat twin engine, the 4½ h.p. Humber is undoubtedly an excellent double-purpose machine. Yet the makers have not been content to let matters rest with marketing one model, and this year they have introduced a really fast sports mount exclusively for solo use. The basis of the design is the same as the touring machine, but so well have "tuning" modifications, such as lighter reciprocating parts, etc., been carried out that speeds up to eighty miles per hour have been obtained. Riding position, controllability, and equipment are such as to make a direct appeal to the clubman and his kind. The price is £100. The touring model, which enjoys an enviable reputation for silence and smooth running, is priced at £110 solo or £144 with a handsome Grindlay sidecar. Black predominates in the colour schemes of all the six Humbers on show, and one all-weather type is finished throughout in that colour. Lubrication is by combined sump, mechanical pump, and drip feed.

## IVY. Stand 198.

Having made a distinct reputation for themselves, the Ivy two-stroke models should command the attention of all who desire a powerful, go-anywhere solo lightweight, or an efficient light passenger machine. The Ivy "Three" was one of the pioneers of the 350 c.c. two-stroke class, and it has demonstrated its capability of taking a sidecar and passenger up much more severe hills than the ordinary user of this class of machine would care to climb. The cylinder of the 3 h.p. Ivy is a heavy and massive casting designed to prevent knocking or pre-ignition even when subjected to prolonged periods of full-throttle running. Tank design and the khaki and black finish combine to make the Ivy models distinctive, and variations between two or three speeds, all chain or chain and belt drive, are obtainable. The 3 h.p. model shown by Rossleigh, Ltd., costs £77 with three-speed gear and all chain drive.

## INDIAN. Stand 180.

Right from the earliest days Indians have had a very successful career in Scottish competitions, and it is only fitting that four representative models should be on view. These are: The most appropriately named Scout, with and without sidecar, the 7-9 h.p. spring frame standard type ("Powerplus"), and the new Chief model, with a Princess



(1) 1¼ h.p. 75 lb. McKenzie lightweight. (2) 7-9 h.p. sporting Matchless outfit. (3) 3½ h.p. sports model Martinsyde. (4) 3½ h.p. standard countershaft Norton. (5) 8 h.p. electrically equipped New Imperial sidecar.

**Motor Cycles at the Scottish Show.—**

sidecar attached. It will be recalled that the latter has a body of American design mounted on an English chassis. The Chief is an enlarged edition of the 4 h.p. Scout model, having skew gear primary drive, full electric equipment, and a re-designed engine of 997.6 c.c. Final drive on all the models is by guarded, but not wholly enclosed, chain, and naturally the Indian three-speed gear box is standard.

### JAMES. Stand 183.

Extending from a £55 two-speed two stroke lightweight to a £186 7s. electrically equipped big twin sidecar outfit, complete with spare wheel, one example of each of the various and varied James models will be shown. Interchangeable wheels and cast aluminium chain cases are amongst the most important modifications to the 7 h.p. sidecar outfit which, less lighting set and spare wheel, is listed at £160. Either with the standard or the carrier sidecar the 4½ h.p. model is £135, and the guaranteed 60 m.p.h. 3½ h.p. sports twin is £105. Both the lightweights have final belt drive, but the more expensive (£60) model has a conventional gear box with clutch and kick-starter in lieu of the twin chain and dog clutch two-speed device. Chain drive and James three-speed gear boxes with clutch and kick-starter are standard on the three larger models.

### LEA-FRANCIS. Stand 199.

One sample of the Lea-Francis productions, a 3½ h.p. M.A.G.-engined sports model, to wit, is exhibited by Andrew Downie, Ltd., of Edinburgh. Pioneers, as such, are often forgotten, so that it is well to recollect that in the pre-1914 era, Lea-Francis machines were equipped with quickly detachable wheels, dummy belt drum brakes on both wheels, and completely enclosed transmission. These details are now common practice, but even so the Lea-Francis machine does not lose its individuality. The price of this sports model is £110; it is to be regretted that no other Lea-Francis machines are on exhibition, as the touring types are characterised by silencing and mudguarding arrangements necessarily curtailed in the sporting specification.

### McKENZIE. Stand 178.

Despite its thoroughly Scottish name, the McKenzie is actually made in Coventry (at the Hobart Cycle Works). However, if the nationality of a machine is judged by that of its designer and producer, this ultra lightweight two-stroke may be ranked as a product of Scotland. Its purpose is to fill the gap that exists between the motor-assisted bicycle and the simplest lightweight motor cycle proper. Pedalling gear is fitted more to ensure a dignified start than as a means of propulsion; and the open frame is intended to attract the lady or the normally overcoated gentleman rider. The spring forks are worthy of special examination. At £26 5s. the little mount is almost in a class by itself. Alexanders are showing it.

### MARTINSYDE. Stand 195.

Three 6 h.p. machines—sporting and touring sidecars and a sporting solo—and a 3½ h.p. machine, which is essentially a solo sports model, comprise the Martinsyde exhibit. Overhead exhaust valves are incorporated in both the V-twin engines—a novel feature which presents undoubted practical and theoretical advantages. Proof is supplied by the many Martinsyde road and track competition successes during the past twelve months, which, for a comparatively new design, make a very creditable list. The important 750 c.c. class hour record, hitherto the prerogative of 500 c.c. machines, is perhaps the Woking production's most noteworthy achievement. £160 for the 6 h.p. touring outfit, £155 for the equivalent sporting type, and £110 for the small solo machine are the chief prices. Alexanders, Ltd., of Edinburgh (Stand 178), will also exhibit Martinsydes.

### MATCHLESS. Stand 196.

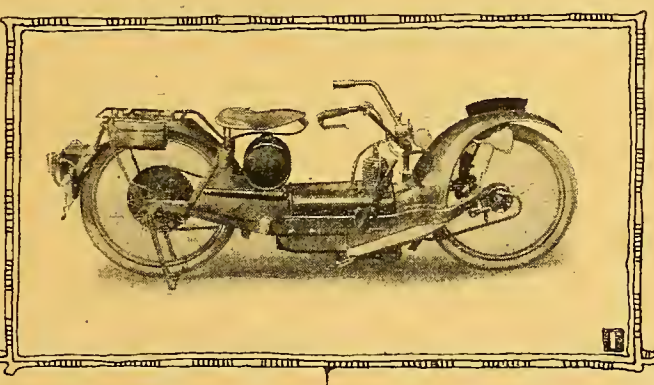
Four Matchless models are shown by the makers, and as this famous big-twin British spring-frame outfit is so well known both in private work and in the open competition world, detailed description or laudatory opinions are almost beside the point. To the rider who demands the utmost luxury that the designer can encompass in a sidecar outfit, the claims of the Matchless must bulk largely amidst the select few from which his choice must be made. Without the electric lighting equipment the Model H2 touring outfit costs £170, and for £5 10s. extra a two-seater sidecar can be supplied. The model J, a rigid framed sporting machine, having nevertheless the same general specification, is £130, and the same machine with a sporting sidecar costs £160.

### MORGAN. Stand 231.

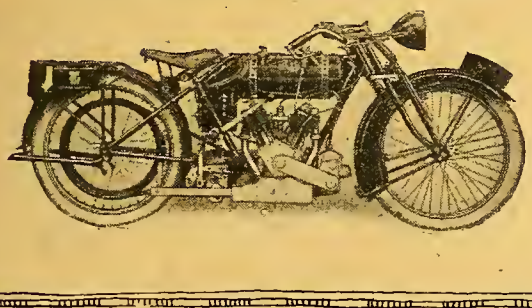
Standing on its three wheels and a solid reputation, the Morgan runabout calls for little eulogistic comment. It is a machine that has provided for itself a special niche in the Temple of Fame, and in no country should it be more successful than in Scotland, where the hills, long and gradual, rather than short and precipitous, might have been planned for a vehicle which owing to light weight and great power has an exceedingly high top-gear performance. Selling at £150 in its cheapest air-cooled form, the Morgan, with its full equipment, represents excellent value; there are more luxurious specifications, however, embodying special coachwork, water-cooling, electric equipment, and even four-speed gears, in which case the £200 mark is exceeded.

### NER-A-CAR. Stand o

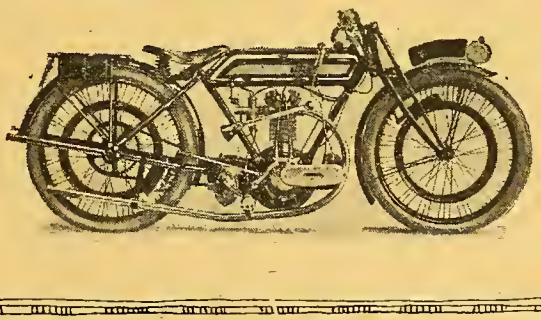
Although not described as a motor cycle by its sponsors



(1)

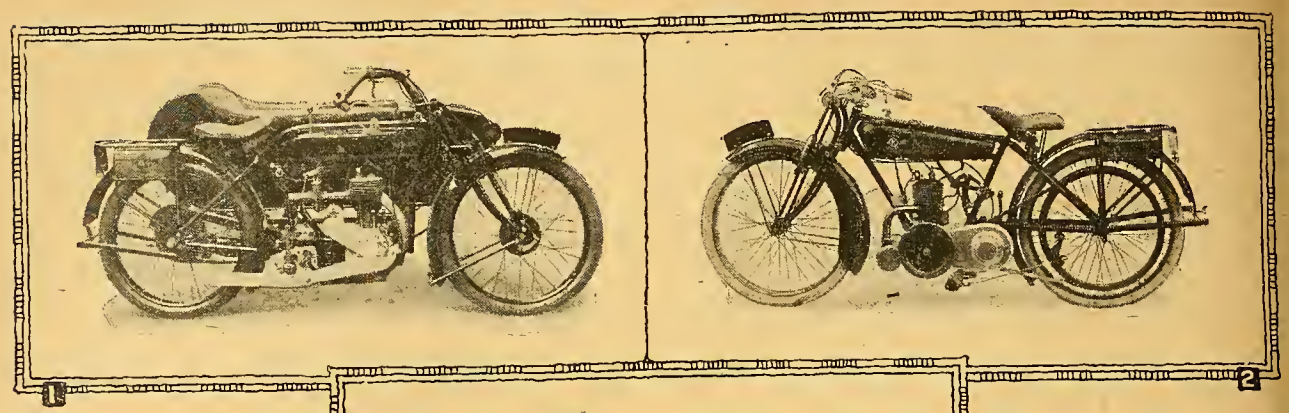


(2)



(3)

(1) 2½ h.p. Ner-a-car. (2) 3 h.p. dynamo model N.U.T. (3) 2¾ h.p. overhead valve New Scale.



(the Inter-Continental Engineering Co., Ltd., 20, Conduit Street, London, W.1), the Ner-a-car finds its way into motor cycle exhibitions and competitions. Motor cycle or not, the Ner-a-car is a machine decidedly interesting to motor cyclists, and it is well worth study. Thanks to its weight distribution and to its (presumably) ideal rake of the steering pivot, the machine is absolutely self-steering, and the most timid rider can travel "hands off" with confidence, while no special skill is required to do a variety of standing-up tricks quite impossible to ordinary riders on ordinary machines. The lay-out of the engine and friction drive in the chassis is workmanlike, and the mudguarding and stability render the machine specially suitable for ladies, business men, and other about-town riders. The price is £69 6s. with full equipment. It is shown also by George and Jobling, Bothwell Street, Glasgow; Stand 205.

(1) 4½ h.p. New Hudson sidecar outfit. (2) 2¾ h.p. two-stroke O.K. (3) 4 h.p. outside flywheel Powell. (4) 4 h.p. four-speed P. & M.

## NEW IMPERIAL. Stand 178.

Great success on the part of one model is apt to overshadow other and dissimilar productions by the same maker. This has been the case to some extent with New Imperial machines, for the 1921 achievements of the light solo models tended to obscure the fact that in the 8 h.p. New Imperial sidecar outfits is one of the most powerful and sturdily constructed machines on the British market. Alexander's of Lothian Road, Edinburgh, are the Scottish representatives, and it will be on their stand that New Imperials will be exhibited. The range produced by the makers covers 2¼ h.p. and 2¾ h.p. lightweights, with variations from chain-cum-belt to all-chain transmission; also the 8 h.p. outfit, with its massive roller bearing hubs and an 8 h.p. solo mount. J.A.P. engines are used throughout.

## N.U.T. Stand 204.

A Dundee agency, Meldrum's, shows the 3½ h.p. N.U.T., which is but one of a variety of machines produced by the Newcastle firm. The 3½ h.p. model staged has a V-twin engine of 64×76 mm. bore and stroke (496 c.c.), and, fitted with Sturmey-Archer gear box, chain and belt drive and Magdyno electric lamp and horn equipment, costs £120. A chain drive model is obtainable, while a sports model, stripped for speed work, and a 5 h.p. sidecar machine, are also made.

## NEW SCALE. Stand 201.

New Scale machines are a product of Manchester, and although built up from proprietary components, the old-established engineering concern responsible for them does not fail to stamp them with an individuality and an evidence of careful work and finish. The model shown on the stand of the D.R. Engineering Co., Ltd., of Dunfermline, is a speedy solo mount embodying an o.h.v. Blackburne engine of 248 c.c. capacity (2¾ h.p.), which transmits its power through chains by way of a Burman three-speed gear box. The price of the machine is £95.

## NORTON. Stand 181.

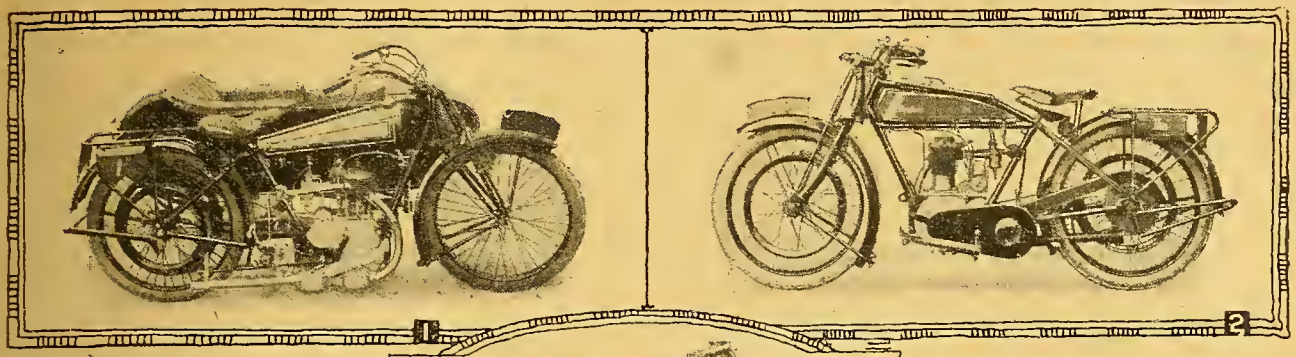
Known to the clubman and tourist alike, Norton machines require little explanatory comment. Their competition successes often in the hands of private owners are not confined to any one district, and thus the Scottish enthusiast is just as likely to be a Norton "fan" as the Brooklands *habitué*. Four representative models will be staged by Norton Motors, Ltd., in addition to machines on Stands 178 and 204. The "big four" (solo £120, with family sidecar £154); the "home" and "colonial" countershaft 3½ h.p. machines, and the still very popular belt-driven "3½" make up the exhibit. Prices of the gear box models are £117 and £115 respectively, and of the single-geared mount £80. A racing sidecar may be obtained at £24 10s.

## NEW HUDSON. Stand 192.

Examples of the 10 h.p. three-wheeler, "Four-point-five" sidecar outfit, and a two-stroke lightweight will be staged by the North British Machine Co., Ltd. Although rather extreme types all three have an enviable reputation for clean design and neat lay-out generally.

Water-cooling, a three-speed and reverse gear box and a pressed channel steel frame are items which give a key to the general characteristics of the runabout. A 1,093 c.c. V-twin M.A.G. engine supplies the power.

Making its *début*, or perhaps more correctly an *encore*, at the last Olympia Show, the 4½ h.p. single-cylinder sidecar outfit is remarkable for its sturdiness of build. 700×80 mm. tyres are used, and both front and rear brakes are of the internal expanding type. A Sturmey-Archer gear box and



chain drive are included. A chain-driven example of the two-stroke lightweight (£63) completes the exhibit.

**O.K. Stand 178.**

So often has the O.K. lightweight scored competition successes as a passenger outfit that one is apt to regard it as essentially a sidecar machine and so to judge it. This is a remarkable testimony to its qualities, but is perhaps a little unfair to the makers, for several of the O.K. models are intended purely as solo mounts. The direct belt-driven mount, for example, which sells at £39 18s.

Chain drive, a three-speed gear box and frame and fork modifications are features of the sidecar machine, which, incidentally, may be further modified to serve as a go-anywhere sporting solo mount.

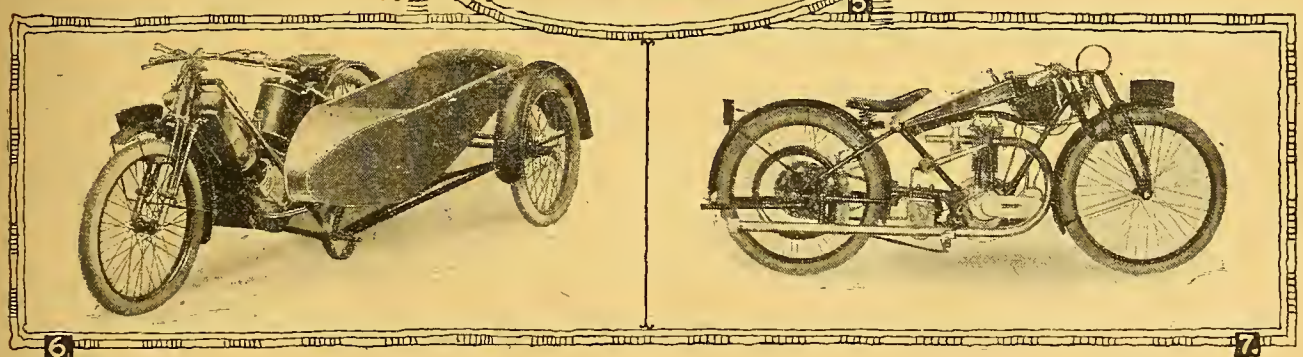
Representative O.K. types will be found among Alexanders' exhibit.

**POWELL. Stand 202.**

A machine which is not so well known as it deserves to be, the Powell is bound to attract the attention of visitors. It is fitted with a 4 h.p. outside flywheel single-cylinder engine, placed in a sloping position in the frame. The primary drive is taken from the outer side of the flywheel. Both as a solo and a sidecar mount, the Powell is sure to be seen in greater numbers on the road this year. It is a Wrexham product, and is exhibited by Harry Gold, of Glasgow.

**P. & M. Stand 178.**

A constant line of development has been followed in the P. and M. machines since their inception in 1903. As the first completely chain-driven motor cycle, and one of the earliest machines equipped with a speed gear, the P. and M. early secured a valuable reputation in the Scottish trials. The new four-speed gear, embodying a two-speed dog clutch box, working in conjunction with the selective clutch mechanism, and the ingenious control will be studied closely at Kelvin Hall, and those who have found the previous 499 c.c. engine just too small for top gear climbing of the long mountain passes with a sidecar will appreciate the 1922 engine of 555 c.c. capacity. Alexanders are showing it.



(1) 4¼ h.p. Quadrant sidecar outfit. (2) 2¾ h.p. Rex Acme. (3) 2⅞ h.p. Royal Scott, fitted with Barr & Stroud sleeve valve engine. (4) 4 h.p. three-speed Rover. (5) 2¾ h.p. Raleigh. (6) 3½ h.p. Scot Squirrel sporting passenger outfit. (7) 2¾ h.p. o.h.v. Sheffield Henderson speed model.

**Motor Cycles at the Scottish Show.—**

**QUADRANT.** **Stands 177 & 178.**

One of the cheapest machines, in price but not in quality, is the 4½ h.p. Quadrant which is exhibited by Alexanders, Ltd. (178) and Pioneer Motors Ltd. (177). At the Olympia Show the Quadrant was undoubtedly accorded a universal measure of praise as offering the maximum value possible to the would-be motor cyclist desiring ample sidecar power with a minimum capital expenditure.

**RALEIGH.** **Stands 199 & 210.**

The Raleigh entry, or re-entry it should be said, into the motor cycle market about two years ago was not made at a very auspicious moment, for when quantity deliveries of the luxurious spring-frame flat-twin machine were possible the public were demanding cheaper and more simple machines. Now a machine with the Raleigh name will meet that demand also; it is a single-cylinder with outside flywheel, the capacity being 350 c.c. in one model and slightly larger (400 c.c.) in another.

Andrew Downie, Ltd., Edinburgh, and V. Jennings and Co., Ltd., Glasgow, are the exhibitors.

**REX-ACME.** **Stand 210**

The Rex-Acme is one of the best finished machines produced in Coventry. Since the reconstruction of the motor industry following the war, Rex and Acme motor cycles have built up an enviable reputation for their makers, and now the two names are merged, and, as Rex-Acme, cover a very complete range of solo and sidecar machines. Several examples of Rex-Acme models are exhibited by V. Jennings and Co., Ltd., Glasgow.

**ROVER.** **Stand 189.**

Twin and single-cylinder models are made by the New Rover Cycle Co., Coventry. The first mentioned has a 5-6 h.p. J.A.P., and is equally popular as a solo mount and a sidecar machine. The 4 h.p. single has a reputation extending over a decade, and is well known on both sides of the border for its consistently good performance in reliability trials. Recent developments have resulted in a fast sports model of the single-cylinder type, and during 1922 it is expected that the Rover name will again be carried to the front rank in speed events. Rover machines will also be shown by the D.R. Engineering Co., Ltd. (210).

**ROYAL SCOT.** **Stand 228.**

Knightswood Motors, Ltd., 98, West George Street, Glasgow, have taken over the manufacture of the Royal Scot machine, which was described in detail in *The Motor Cycle* recently, and will show six examples of their product on Stand 228.

The main point of interest about the design is the inclusion of a Barr and Stroud single-sleeve valve engine and Montgomery front forks.

**SCOTT.** **Stand 198.**

By virtue of being the only water-cooled twin-cylinder two-stroke motor cycles on the British, or, indeed, the world's markets, Scott machines occupy a unique position.

With a guaranteed maximum speed of 60 m.p.h., the now year old 3½ h.p. Squirrel model has proved itself able to maintain as high an all-round average speed as almost any sporting machine in existence. Solo, it weighs less than 200 lb., or, as shown by Rossleigh Motors, Ltd., with an aluminium sidecar, not much more than 260 lb.

**SHEFFIELD HENDERSON.** **Stand 178.**

At Olympia the 2¾ h.p. racing model Sheffield Henderson was seldom without an interested crowd of spectators and, one might almost add, admirers. Its rakish appearance, accentuated by a small capacity competition tank, the complete absence of mudguards, and the presence of a pair of speed event number plates, gave an impression of wonderful speed capabilities.

**SUN.** **Stand 204**

Unfortunately the most interesting Sun model—a two-stroke with a rotary inlet valve in the crankcase—will not be on exhibition; but the 292 c.c. J.A.P.-engined machine on the stand of Meldrum's (Dundee) will serve to indicate the general standard of Sun quality and finish. With 2-speed gear, clutch, and kick-starter, the price is £63, and the weight 185 lb.

**SUNBEAM.** **Stand 210.**

It is difficult to say which of the new Sunbeam models is the more attractive. Their purpose is different; and, while the sidecarist who welcomes the 4¼ h.p. outfit as just what he has wished for may almost ignore the fleet-looking new long-stroke T.T. model, the ardent soloist, most probably, will look at things in an entirely reverse direction. This is as it should be; the dual-purpose machine is, after all, but a compromise.

V. Jennings and Co., Ltd., Glasgow (210), Pioneer Motors, Ltd., Edinburgh (177), and the D.R. Engineering Co., Dunfermline (201), all exhibit Sunbeams.

**TRIUMPH.** **Stand 193.**

Undoubtedly the new four-valve model will be the centre of interest on the Triumph stand, if not of all the motor cycle exhibits in the building. This model is not yet sufficiently common on the road to be familiar to every motor cyclist, but its clean design, its early successes in competition, and the reputation of the Triumph Company for a very high standard of detail, finish, and, consequently, reliability, combine to ensure that shortly it will become as popular as the other products of the firm. The 499 c.c. o.h.v. engine is of Ricardo design, and, while remarkably efficient, is neither complicated nor unduly noisy. Excepting Druid forks, 26×3in. tyres, and improved gear lever, handlebar and foot-rest locations, the "bicycle" portion of the machine follows the lines of the chain-driven "four." Our experience on the road proved that these exceptions made an entirely different machine of it—more "racy" in feel and more controllable generally. The price is £120.

Chain- and belt-driven standard models, with and without sidecars, and an example of the popular 2¼ h.p. two-stroke will also be staged, both on Stand 193 and on the near-by stands of Chas. Middleton and Son, Ltd., Glasgow (194), and Rossleigh, Ltd., Edinburgh (198).

**TRUMP-JAP.** **Stand 177.**

One example of the re-introduced Trump-Jap will be shown—a 292 c.c. lightweight on the stand of Pioneer Motors, Ltd., Edinburgh. Tastefully finished in black and gold, it possesses a certain air of distinction, despite the fact that very commonly used components are incorporated in the design. The Amac carburetter, M-L. magneto, and Hutchinson tyres are all well at the top of their classes; so fitted, and with a two-speed gear box, the 2¾ h.p. Trump is priced at £60.

**VELOCETTE.** **Stand 178.**

Only one stand (Alexanders') will bear an example of the Velocette lightweight; but this is no adverse index of the popularity of this high-class two-stroke in Scotland. The Velocette emphatically does not come into the large class of assembled machines, but various competition and freak hill-climbing successes, as well as its service in the hands of private owners, proves that it loses nothing by being distinctive. Two- and three-speed touring models, guaranteed 50 m.p.h. sporting machines, and a ladies' model are among the variations offered. There are also two sizes of slightly differing engines of nominally 2¼ h.p.

**VICTORIA.** **Stand 200.**

As befits a Glasgow production, the array of Victoria machines on Stand 200 is very complete, there being no fewer than eleven models, all more or less different. Perhaps the best examples of value are the 350 c.c. J.A.P.-engined three-speed sidecar outfit at £85, and the sports model with an o.h.v. Blackburne engine at £80. Other Victoria types include a £39 18s. Villiers-engined lightweight and a 550 c.c. J.A.P. three-speed sidecar outfit at £110, the models lying between these extremes being priced proportionately.

**ZENITH.** **Stand 178.**

Among the nineteen odd makes on Alexanders' stand there will be at least one Zenith or Zenith-Bradshaw. On account of its oil-cooled power unit the latter is perhaps most likely to arouse attention.

# CURRENT CHAT

Number plates to be illuminated thirty minutes earlier. *vide* Road Vehicles Registration and Licensing Order (1921).

### Manufacturers at the Scottish Show.

Although this is not the first occasion on which a motor cycle show has been held in Scotland, the present exhibition is the first of its kind directly supported by manufacturers. Twenty stands are occupied by the actual makers of the machines which are staged thereon.

### Next Week's Dates for "The Motor Cycle Film."

Appreciations continue to flow in from each of the four clubs to whom, on the average, *The Motor Cycle* is shown weekly. To-night (Thursday), it will be exhibited at the Theatre Royal, Bradford on behalf of the enterprising Bradford M.C. and L.C.C.; to-morrow it goes to the Peterborough Palladium through the agency of the local motor cycle club, and on Monday it will be shown at the Tredegar Hall Picture House, Stow Hill, Newport, Mon. by arrangement with the Newport and County M.C.C. On Wednesday, February 1st, it returns to Yorkshire for an event organised by the Sheffield and Hallamshire M.C. and L.C.C.

### Where is it?

Last week we published a letter from a reader asking the location of a certain dimly remembered hill. From the scores of replies that have been reaching us daily since, there can be no doubt that the mystery grade is School Hill, situated practically in the centre of Lewes, Sussex.

### The Moto-Cycle Club de France.

The Moto-Cycle Club de France held its annual general meeting recently, when M. Hamon was re-elected President. M. Hamon has taken a great interest in motor cycle trials, and in those of an international character, in which he has held an official position, he has always meted out perfect justice to French and British competitors alike.

### Motor Thieves and Licensing System.

Speaking at the annual dinner of the Birmingham M.C.C., the Chief Constable, C. H. Rafter, mentioned the great service rendered both at home and abroad by motor cyclist "D. R.s."

Referring to the new system of licencing, he did not believe that any check had been put on the thefts of machines by this means.

During 1920, in Birmingham, 15 cars and 34 motor-cycles were stolen, and 8 cars and 18 cycles were recovered. In 1921, practically the figures were repeated, 11 cars and 36 motor cycles being stolen and 4 and 13, respectively, recovered.

### Prizes for Tour de France.

A sum of 30,000 fr. has been voted by the Municipality of Montargis towards prizes for the 1922 Tour de France. The last Tour de France in which an English competitor took part was in 1905, when the whole course was covered by J. Van Hooydonk, one of the oldest pioneers of the British motor cycle industry; he rode a Phœnix-Trimo.

### 230 Mile 12-hour Open Trial.

Instead of the hill-climb first announced as the April 1st open event of the Western Centre A.C.U., a twelve-hour reliability trial will be held over a route of about 230 miles, starting at Stourbridge and finishing at Worcester, the lunch stop being at Clevedon, Somerset. The trial will be on the lines of last year's very successful two-day event.

## Special Features.

FAMOUS SCOTTISH HILLS.
CLUB LIFE ACROSS THE BORDER.
MOTOR CYCLES AT THE SCOTTISH SHOW.

### A Twenty-four Hours' Trial in France.

The French Association of ex-military motor cyclists intends to organise a 24 hours' trial on May 28th for a gold cup. The competition will be open to motor cyclists and drivers of cycle cars, and will take place on a closed circuit close to Paris. The start will take place on the Saturday at 3 p.m. One clause in the rules limits the number of hours (probably 4) which will be allowed to each competitor for replenishment stops.

### Sidecar Fuel Consumption Records.

In *The Motor Cycle* of the 12th inst., there was published a letter from Mr. H. B. Booth suggesting a meet of Triumph sidecar owners for the purpose of getting to the bottom of the fuel consumption controversy. Those interested were invited to send the following particulars: (1.) Year of machine. (2.) Type and make of sidecar. (3.) Type of screen. (4.) Weight of outfit. (5.) Carburetter and jet number. (6.) Gear ratios. (7.) Oil used and mileage per pumpful. (8.) Other particulars of interest. Several correspondents have already written Mr. Booth expressing a desire to participate in the test; will others who are interested please write to the organiser direct at 285, Harrow Road, London, W.9.

BABY RUNABOUTS IN THE SNOW. These two little Harper three-wheelers, which are fitted with 2½ h.p. two-stroke engines, found no difficulty in negotiating Waneth Low hill, in Cheshire, during the recent snowy weather.

# ANNUAL GENERAL MEETING OF THE A.C.U.

THE annual general meeting of the Auto Cycle Union, which was held at 3 p.m. on Saturday afternoon last, was purely a formal affair, and lasted exactly half an hour. The chair was occupied by the Hon. Sir Arthur Stanley, G.B.E., M.V.O., C.B., president of the Auto-Cycle Union, who, having announced that the notice of the meeting had been mentioned in the papers three weeks previously in accordance with the rules, proceeded with the election of president and vice-presidents. As the exact number of candidates for which there were vacancies had been nominated, and they were the same gentlemen as were elected last year, they were on the proposal of Col. F. S. Burston, C.B.E., seconded by Mr. H. P. E. Harding, re-elected. The Hon. Sir Arthur Stanley was re-elected president of the A.C.U.

The last item on the agenda stated that as no recommendations for the advancement of motor cycling had been received, the business of the meeting was ended. But the chairman before closing the meeting asked the secretary to say a few words about the Union membership.

Mr. T. W. Loughborough, on rising, referred to the value of the work done by the local centres in propaganda; decentralisation of the headquarters work had been very valuable in this respect, and for a long time the Union had suffered from inability to blow its own trumpet. For many years the A.C.U. had been the only body looking solely after the interests of motor cyclists, but when he compared the number of A.C.U. members to the number of motor cyclists registered, he found these sadly disproportionate. The question of new legislation was coming up again when the antiquated motoring laws would be revised. Consequently the help of all motor cyclists was needed, and a new membership campaign should be begun at once.

Then followed the meeting of private members, which, in the space of a few minutes, elected the following members to fill the five vacancies of their representation on the general committee: S. L. Bailey, E. B. Ware, W. Cooper, D. H. Noble, and V. C. Hardy.

# CLUB NEWS.

### Featherstone and District M.C.

The annual meeting was held at headquarters, The Travellers' Hotel, Purston, on Thursday of last week, and runs for April were decided upon.

### Taunton and District M.C. and L.C.C.

The annual meeting of the Taunton and District Motor Cycle and Light Car Club was held at the Castle Hotel on Tuesday evening of last week, Mr. Stuart Goodman presiding. Officers for the ensuing year were appointed. Mr H. T. Kite, honorary secretary of the South-Western Centre, announced that the following dates would be fixed for Centre events: May 20th, open trial run by the South-Western Centre; June 3rd, Lands End trial run by the Yeovil Club; June 17th, reliability trial, Exeter; July 1st, reliability trial, Taunton; July 22nd, Weston-super-Mare Club; August 12th, hill-climb, Tiverton.

### Birmingham M.C.C.

Mr. E. R. Lycett presided at the annual dinner, which was held at the Midland Hotel on the 13th inst. After the toast of "The King" had been proposed by the President, Major R. V. C. Brook arose to toast "The Club." He stated that the Club was started in 1903 with as few as twenty members, and that to-day the membership stood at 380. It was the largest organisation of its kind outside London—a very proud fact for members to keep in mind.

### South Birmingham M.C.C.

On Saturday, the 14th inst., in spite of two inches of snow, members of the club made an attempt to climb a new hill which has been discovered by the club officials. Situated near Gay Hill, six miles from Birmingham, the approach is through a series of small streams of water, the surface of the hill being grass-covered. Not one machine succeeded in making a clean climb, although ropes were tied round the rear tyres.

The best attempts were made by H. Perrey on a 4¼ h.p. B.S.A. sidecar, and Bert Kershaw on a 2¾ h.p. New Imperial. In every case the driving wheel dug itself in up to the axle, and came to a standstill.

### North London M.C.C.

The second annual general meeting was held recently at the club's headquarters, "The Orange Tree," Friern Barnet, when the officers and committee for the ensuing season were elected.

### Essex M.C.

On a recent Friday the club gave a treat to the Piggott Street East Cripple School. The young guests had an excellent tea, followed by a splendid entertainment, and before being taken home each one had "a dip from a bran tub."

### Surrey M.C.C. and L.C.C.

The annual general meeting was held at Guildford on Wednesday, January 11th, last. The secretary presented his report, which was passed, and showed that the club was in a good position.

Amongst other business discussed at this meeting was the change of title of the club, which was carried. It is pointed out that the club, which was founded in 1907, covers a very wide area, and is therefore divided up into four centres, *i.e.*, London, Guildford, Dorking and Farnham, and Farnborough; each section has its own offices and representatives on the main committee.

The honorary secretaries for the different centres are: Dorking, Mr. S. T. G. Meeken, 41, South Street, Dorking; Guildford, Mr. H. Mitchell, "Viewfield," Woodland Road, Guildford; London, Capt. P. G. Robinson, "Evenley," Carshalton Road, Sutton, Surrey; and the Farnham centre, Mr. Mansell, "Pendenius," Church Circle, South Farnborough, Hants.

### South-Eastern Centre A.C.U.

It was decided at the last meeting of the centre to grant four permits only during 1922 for events open to the centre. In addition to the open reliability trial to be run by the centre itself on July 8th the programme as at present arranged will include the Ealing and District M.C.C. twenty-four hour reliability trial from London to Holyhead (April 28th-29th); Woolwich, Plumstead, and District M.C.C. team trial (May 13th); Brighton and Hove M.C.C. hill-climb (June 24th); and the Surbiton and District M.C.C. speed trial at Brooklands (September 2nd).

### Ilkley M.C. and L.C.C.

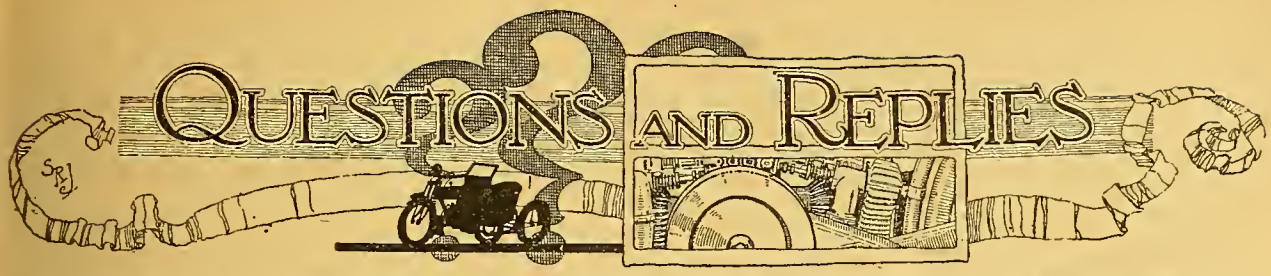
Dr. A. M. Low and Mr. Kaye Don were the principal guests at the annual dinner at the Lister's Arms Hotel, Ilkley, on the 20th inst., when Capt. J. N. Longfield, the president of the club, presided over a large attendance, which was well representative of the wide area covered by the club's operations. It was a thoroughly merry party from start to finish. Dr. Low, in proposing the toast of "The Club," commented upon the sense of fellowship which was to be seen amongst all the members.

Mr. H. W. Sellers, the honorary secretary, in responding, said the club commenced the year with 124 members, and they now had 180. The committee had come to the conclusion that trials as run at present were monotonous and boring, and they were going to launch next year a scheme to make motor cycles still more popular. Though the open trial allotted to the Ilkley Club last year was not financially successful, they had been informed that the report handed in by the A.C.U. steward was the only really satisfactory report handed in for any reliability trial held in the country.

### North-Eastern Centre A.C.U.

At the instigation of the Sunderland and District M.C., a meeting of Northern clubs was held in the Y.M.C.A., Sunderland, on January 12th, the object being to form a local centre of the A.C.U. Since the decision of the general meeting of the North-Eastern Automobile Association to wind up that organisation, a decision that was afterwards annulled by its General Committee, there has been a good deal of discussion in the area.

Mr. T. W. Loughborough, the secretary of the A.C.U., attended and explained the position of the A.C.U., and the benefits derived from affiliation with his Union. He suggested that an emergency committee be formed to get together the necessary six clubs to form a new centre, a suggestion that was adopted. The committee comprised two members from the Newcastle and District Club, two from the Sunderland and District, and two from the Annfield Plain Club, the convenor being Mr. W. Baxter (Newcastle).



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," Corset House, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the top left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

ROUTES.—By special arrangement with the Automobile Association and Motor Union, readers of "The Motor Cycle" desiring routes may enjoy the benefit of the Road Service Department of that organisation. Queries should be addressed to the Editor in the ordinary way (enclosing a 2d. stamp), and will be dealt with by the A.A. and M.U., who are regularly in receipt of reports from their representatives all over the country as to the existing state of the roads in any particular locality.

### DISMANTLING AND REBUSHING.

My machine is a reconstructed W.D. Triumph, and it is my intention to fit new bushes throughout. (1) What, briefly, is the best method of dismantling the engine? (2) Are the main bearings of this engine (about 1918) roller or plain? (3) I notice that connecting rod new bushes are frequently advertised. Are these articles usually bought in the rough or are they sent out ready for fitting?—J.L.

(1) It is impossible to describe fully the method of dismantling a Triumph engine. If you have the mechanical ability it is an absolutely straightforward job, as the taking apart of the crankcase, drawing the ball-bearings from the main shaft, and separating the flywheel is done by methods commonly used on all engines of this type. There are no left-hand threads, and all the shafts (where detachable) are fitted on tapers. (2) The main races are ball bearings, and the big end has roller bearing. (3) The connecting rod bushes which you mention are, no doubt, turned up ready for use, but it is quite likely that they will need "fitting" either externally or internally, or both, by scraping and reaming.

### LOCATING A BUSINESS VENTURE.

I am thinking of opening a country garage and tea-room, stocking petrol, oil, tyres, and a wide range of spares for all makes of motor cycles, and should like to have your opinion of where I could find a most suitable spot, with plenty of wayside traffic, etc.?—W.H.S.D.

We are afraid that the question you ask is beyond our scope. There must be literally hundreds of thousands of places such as you describe, and to name any one of them as being most suitable is quite impossible. Your best plan is to look out the possibilities of places in your own immediate neighbourhood.

### ENGINE SPROCKETS FOR ENFIELD GEAR.

Will you tell me how many teeth I shall require on my engine-shaft, as I have just purchased a new 2¾ h.p. two-stroke engine and I desire to use an Enfield two-speed gear which I possess; there are twenty-seven teeth on high gear drum and thirty-eight on low gear, the final drive is by 6in. belt pulley and 19½in. belt drum on 26in. wheel. I think if geared at 5½ to 1 high and 9½ low, it should be quite suitable.—J.H.C.

You would need a fifteen tooth sprocket for the high gear and a thirteen tooth for the low.

## Important Dates.

**Fri., Jan. 27th, to Sat., Feb. 4th—Scottish Car and Motor Cycle Show.**
**Sat., Feb. 25—Sutton Coldfield and North Birmingham A.C. Colmore Cup Trial.**
**Sat., Feb. 25th, to Sunday, Mar. 5th—Belgian Motor Cycle Show. Palais Degmont, Brussels.**
**Wed., Mar. 1st, to Sun., Mar. 5th—Paris—Nice Trial.**
**Sun., Mar. 5th—Argenteuil Hill-climb (France).**
**Mon., Mar. 6th—La Turbie Hill-climb (Nice).**
**Wed., Mar. 15th—A.C.U. One-day Trial for Stock Machines.**
**Sat., Mar. 18th—Birmingham M.C.C. Victory Cup Trial.**
**Thurs., Mar. 23rd—East Midland Centre A.C.U. Open Reliability Trial.**
**Sat., April 1st—Western Centre A.C.U.—Open Reliability Trial.**
**Sat., April 8th—B.M.C.R.C., Members' Meeting at Brooklands.**
**Fri., April 14th, and Sat., April 15th.—M.C.C. London-Land's End Run.**
**Sat., April 22nd—N.-Eastern Centre A.C.U. Open Reliability Trial.**
**Sat., April 29th—S. Midland Centre A.C.U. Open Hill-climb.**
**Mon., May 1st, to Sat., May 6th—Scottish Six Days Reliability Trials.**
**Sat., May 13th—Northern Centre A.C.U. Open Reliability Trial.**
**Sat., May 20th—S.-Western Centre A.C.U. Open Reliability Trial.**
**Tues., May 30th—Junior Tourist Trophy Race.**
**Thurs. June 1st—Senior Tourist Trophy Race.**

### DAMAGED BEARINGS.

Just recently I have had trouble with my 2¼ h.p. two-stroke, owing to using thin oil. I had the engine taken down, decarbonised, and new piston rings put in, but since so doing, I get a "chunk" in the engine as if piston is seized. Could you please tell me the reason, as it is a new machine only four months out of the factory?—H.C.

Without more complete information, it is impossible to tell you the cause of the noise in your engine, but we should imagine either that one of the bearings is badly worn or that the piston itself has been damaged by the use of the unsuitable oil which you mention. If the noise is due to a worn connecting rod bearing, you should be able to trace this by rocking the piston over top dead centre when the engine is warm, with the sparking plug removed. The play in the bearings will be felt at the flywheel as you swing the engine backwards and forwards.

### IT WOULD BE NICE!

I intend buying a 2¾ h.p. Blackburne engined machine. Could I fit to it an attachment or gear which would at will convert it into a two-stroke engine, and would such conversion give me an increase of power? Are there any such converting attachments on the market? If there are have they proved a success? If there are none, is the idea a feasible one?—BEGINNER.

There is no such device as that which you outline. We think your best plan would be to obtain a copy of "Motor Cycles and How to Manage Them." You will then appreciate why the scheme you suggest is impracticable.

### GEAR RATIOS, SPROCKET AND CHAIN SIZES.

(1) I have a 2½ h.p. two-stroke two-speed lightweight with 15 and 30 teeth by ½in. pitch on engine-shaft and countershaft sprockets respectively giving gears of 5 and 9 to 1, and as I am having a Villiers engine-shaft clutch fitted, and the smallest engine sprocket is 16 teeth, what would that make my top gear? (2.) As I am thinking of fitting a light sidecar, and, in any case normally carry a 6 st. passenger, would you advise reducing the gear to about 5¼ or 5½ to 1, and what countershaft sprocket should I require with a 15 tooth and 16 tooth engine sprocket respectively? (3.) Would there be any advantage in fitting ⅝in. sprockets and chain?—H.E.

(1.) The top gear would be 4.7 to 1. (2.) To use a light sidecar it would be advisable to lower the top gear to 5½ to 1. With 15 teeth and 16 teeth engine sprockets the countershaft sprocket would need to have 33 or 35 teeth respectively to give this ratio. (3.) There would be no advantage in fitting ⅝in. pitch chains and sprockets; ½in. × ¼in. should be ample.

### IRREGULAR FIRING.

"Missing" has been a frequent trouble with my 6 h.p. Bradbury sidecar, mainly, if not entirely, in the front cylinder. A local repairer diagnosed magneto trouble, and I have had the magneto tested and remagnetised. I then fell back on carburation. The carburetter is a B. and B. variable jet, and the standard jet and setting of the needle for my machine are .055 jet and needle $1\frac{29}{32}$in. I am now using a .043 jet, and the needle projects $2\frac{1}{8}$in. from the recessed face of the valve, so that when the throttle is closed the needle goes practically to the bottom of the jet. The engine does not now miss on top gear, except in slow running, but on second and low gear the missing is pronounced. I can scarcely use a smaller jet without losing power, as my best speed now is 35 m.p.h. Can you suggest a remedy or indicate some other cause of the trouble?—W.G.B.

Misfiring on one cylinder in the case of twin-cylinder engines is usually caused by air leaks in the induction system, either at the inlet pipe joints or inlet valve guides. In the case of the 6 h.p. Bradbury engine, of course, another possible location for air leaks is the jointing of the detachable heads, and these should be very carefully fitted. From your description, however, it is not clear that the misfiring is due to this cause, and it is just possible that an ignition fault is at the root of the trouble. It would be advisable to experiment with variations of sparking plug gaps, and also to make quite sure that the contact breaker points separate to an equal extent for both cylinders.

### CHOOSING A LIGHTING SET.

Will you give me your advice in the choice of a lighting set? I have just bought a 4 h.p. Triumph, and as I expect to do a considerable amount of night riding, the initial cost is only a secondary consideration. I wish to be able to keep up a high average speed. Perhaps you will place the following methods of lighting sets in order of merit: *(a)* Dynamo set; *(b)* magneto-dynamo combined equipment; *(c)* acetylene; and *(d)* Fallolite. What is the best way of fitting a dynamo to a W.D. Triumph? If otherwise satisfactory, I suppose *(b)* would be the easiest to fit.—F.W.W.

For convenience we should certainly recommend an electric lighting set, but unfortunately you might experience difficulty in fitting one of the regular dynamo outfits. The magneto-dynamo sets may be fitted with a minimum of difficulty, but the light in certain cases does not compare with that given by the six volt dynamo sets; at the same time we have found them very reliable, and if your machine is not used with a sidecar, it would be possible to run a slightly more powerful bulb in the head lamp than that supplied as standard. Acetylene is easily installed, but demands frequent attention. The Fallolite set gives a powerful light with a minimum of trouble, but the supply of dissolved acetylene refill cylinders is rather a problem in an out-of-the-way district.

### Found on the Road.

A magneto contact breaker was picked up by Mr. F. R. Weatherhead, of 13, Berridge Road, Upper Norwood, S.E.19, in Crystal Palace Park Road, S.E., on the 15th inst. The loser should forward a description and the time of his loss to the above reader.

### Petrol Pumps and State Supervision.

For some time the question of bringing self-measuring fuel supply pumps under the control of the weights and measures authorities has been considered by the Board of Trade. The petrol companies, who are the chief distributors of delivery pumps, have made continuous efforts with this end in view in the interests of the general public.

### Carriage Paid to any Station.

To the list of firms which are now offering to pay carriage on their goods to any station in Great Britain and which make no charge for crates, must be added the name of Watsonian Sidecars, Conybere Street, Birmingham.

### The A.C.U. Outdoor Representative.

It may not be generally known that the A.C.U. employs an outdoor representative for the purpose of visiting hotels and repairers to see if they are suitable for official appointment, to investigate cases of dispute and generally to look after the interests of the A.C.U. on the road. These duties have up to recently been ably carried out by Mr. P. A. Iles, who has now left the service of the Union to manage the Duke's Head Hotel, Addlestone, where he will specially look after those motor cyclists who are stopping in the vicinity of Brooklands Track. The new A.C.U. outdoor representative is Mr. E. W. Hodson.

### To Keep the Licence Clean.

An excellent device for keeping the licence card dry and clean is the Licenseal outfit. The card is held between two discs, one black and the other transparent, held together with a special solution. The result is that the licence card is kept absolutely free from moisture, it is impervious to water, oil, and spirit, and is, moreover, non-inflammable. In the case of the licence-holder glass being broken no damage to the licence can ensue.

### Without Preparation.

Owing to non-delivery of his 5 h.p. N.U.T., which he entered in the London-Exeter trial, W. Henry Wells, of Maudes' Motor Mart, used a $3\frac{1}{2}$ h.p. Sports Sunbeam in the run; it was taken over at the last moment and went through without trouble, and its rider gained a gold medal.

### To Help Club Secretaries.

A resident London and Home Counties representative has been appointed by the Birmingham Medal Co., a concern specialising in the manufacture of trophies, silverware, etc., suitable for competition awards. The representative appointed is Mr. Alan W. Day, of Claremont, Ballards Lane, Finchley, N.3.

### Catalogues Received.

Williams and James, Chequers Bridge, Gloucester: A catalogue of petrol engines and components. This firm specialise in the production of pistons of all sizes and types, gudgeon pins, piston rings, and aluminium air-cooled valve caps. These parts are made for all the best-known makes of motor cycles.

The Villiers Engineering Co., Ltd., Blakenhall, Wolverhampton: Lists for the season 1922, giving particulars of the latest type Villiers two-stroke engine and the flywheel magneto. Details are also given of the Villiers lighting set, which derives the current from the flywheel magneto, and of the Villiers engine shaft clutch. There is also a list of spare parts, which are named, numbered, and priced, while the book concludes with a list of twenty-two hints and tips for users of the engine.

The British Piston Ring Co., Ltd., Holbrook Lane, Coventry: The 1922 Brico catalogue and piston ring directory. A complete list of piston rings with full dimensions and particulars for practically every motor cycle engine on the market, also a list of gudgeon pins to suit all the best-known engines. The Company also deal in piston ring castings and the Bricometer, a steel tape for measuring pistons and piston rings.

---

## EXPERIENCES WANTED.

*Readers' replies to questions published under this heading should be addressed c/o The Editor, "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4, when they will be forwarded direct to the querists concerned.*

"F.F.P." (Botley).—$2\frac{1}{4}$ h.p. Triumph: Binks carburetter (jet sizes). Castrol as lubricant, general hints. Also $2\frac{1}{4}$ h.p. Velocette: Reliability and general advice.

"R.H." (Ludlow).—Tritube sidecars: Suitability for attachment to $3\frac{1}{2}$ h.p. Rudge Multi.

"J.F.D." (Cambridge).—Degory carburetter on Villiers two-stroke engine.

"J.W.E." (Neasden).—Grado gear, with or without kick starter on $3\frac{1}{2}$ h.p. sporting Abingdon; Range of gears, suitability for sidecar work, reliability, ease of control, any particular weakness.

"E.C." (Bolton).—Carden cycle-car, general experiences.

"F.G.C." (New Cross).—Alldays Allon: Speed, consumption, general utility and reliability for light tourist purposes.

"A.C.T." (E. Dulwich).—Low acetylene generator.

"A.H.H." (Liverpool).—$3\frac{3}{4}$ h.p. Scott, solo: M.p.g. (fuel and oil and general efficiency).

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns —First 12 words 3/–, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable & Co. to ILIFFE & SONS Ltd., and crossed Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning previous to the day of issue. Advertisements that arrive too late for a particular issue or that are crowded out will automatically be inserted in the following issue unless accompanied by instructions to the contrary.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4. *Readers who reply to Box No. advertisements are warned against sending remittance through the post except in registered envelopes; in all such cases the use of the Deposit System is recommended, and the envelope should be clearly marked "Deposit Department."*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor. Carriage is to be paid by the buyer, but in the event of no sale each party pays carriage one way. The seller takes the risk of damage in transit. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6 and on all transactions over £100, 1%. All deposit matters are dealt with at Dorset House, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## MOTOR CYCLES FOR SALE.

# WHEN YOU REQUIRE SPARES . . .

# THINK OF GODFREY'S

# IT SAVES TIME . . .

For many years we have had a Special Department which deals exclusively with Spare Parts, and during that period the scope of their activities has consistently increased. To-day we are carrying complete stocks of Spare Parts for the following machines:—

## B.S.A. INDIAN SCOTT LEVIS

**and SENSPRAY CARBURETTOR and BURMAN GEARS**

OUR OBJECT has always been to make this Service a real one in the sense that whatever the requirement, whether it is for a complete Cylinder or only a small Washer, the part can be supplied immediately from our Spares Dept.

OUR MAIL ORDER DEPARTMENT deals intelligently with enquiries and orders received by post, and the Service Scheme we recently inaugurated ensures immediate despatch without the aggravating delay of pro-forma invoice.

# THE BURNING QUESTION

Where shall you go for that Motorcycle or Combination? Where can you get at such low prices properly overhauled second-hand machines with a three months guarantee (the same as for a new one)? Where can you see, and get quickest deliveries of, all New 1922 models? Where can you get the easiest of easy terms? Where can you get the best genuine allowance for your present machine taken in part exchange?

The one and only answer is:—The firm who specialises in these things and the firm with the longest and highest reputation—that is The Service Co.

In addition — no matter what you buy or how you buy it, *your* satisfaction is our one consideration. Your enquiry, whether for an inexpensive second-hand lightweight or a 1922 Combination de Luxe, will be esteemed.

## PAYMENTS TO SUIT MOST POCKETS

# The pitfalls that await the unwary!

The intending purchaser of a motor-cycle avoids all risk if he places himself in the hands of a reputable agent. The transaction is not then a battle of wits, and the buyer does not need a profound knowledge of matters mechanical to ensure receiving value for his money.

¶ **THE EASTERN GARAGE CO.** confine their contracts for new motor-cycles to a comprehensive range of models produced only by the most reliable makers, and any machine they recommend can therefore be depended upon for good service.

¶ In the case of secondhand motor-cycles it is the inflexible rule of THE EASTERN GARAGE COMPANY to overhaul each one in detail and issue a full guarantee with it. In this way they accept responsibility for the condition of the machine and the purchaser is relieved of any concern as to its mechanical efficiency.

¶ If you will apply for catalogues of new mode's or a list of secondhand motor-cycles you are certain to obtain the machine that is most suited to your requirements, and any advice you may need will be given in a capable and courteous manner.

¶ Should you desire to extend payment over a period, the transaction would be confined sole'y to yourself and the Company, and the charge for this accommodation is only 4%, except in the case of one or two makes the manufacturers of which have fixed a higher rate for credit sales of their new models.

¶ The fact that THE EASTERN GARAGE COMPANY value above all else the good name they have earned, demands that their every effort be devoted to ensuring the satisfaction of each and every one of their customers.

**THE EASTERN GARAGE CO.**

(Official Repairers to R.A.C., A.C.U., A.A., & M.U.)

**418 ROMFORD ROAD, FOREST GATE, E.7.**

Telephone ..... 490 East Ham.
Telegrams ..... "Egaraco, London."

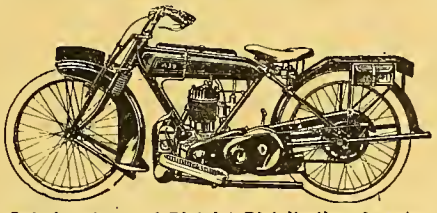
GET IT AT

# TAYLORS



Sole London and District Distributing Agents for A.J.S., Excelsior, and Dunelt Motor Cycles.

THERE is far more satisfaction and much greater security in buying a good machine from a reliable Agent than in picking it up anywhere—you know what we mean. Taylors have 12 years of honest trading at the back of them and a reputation second to none amongst Motor Cycle dealers. There is a reason!! Taylors have always made it their business to take just as much interest in their customers as in their prospective customers; in other words—Taylors give real service.

## SOME TYPICAL EXAMPLES OF 1922 MOTOR CYCLE VALUE.

**Exit Racing!**

**Now to**

**BUSINESS!**

For years we have raced. with a fair splash of success, but as a friend reminds us, "every dog has his day," and this one must now scratch for a living. Racing is a fine game, it bucks up your ideas, keeps you young and full of energy and pep. It makes you study the job hard and provides you with invaluable experience. in fact the attributes of a successful racing man seem similar to those of any other kind of successful man.
Well, all that is for you now, we've settled down to business.

**WHAT CAN WE SELL YOU?**

We handle a very desirable string of Agencies. Do you want anything from this list:—

INDIAN, VELOCETTE, RALEIGH, NORTON, SCOTT MARTINSYDE, QUADRANT' LEVIS, G.N. and LAGONDA CARS?

We sell for CASH, EASY PAYMENTS, or will take your old machine —in EXCHANGE.—

**VICTOR HORSMAN, Ltd.**
**7, Mount Pleasant, LIVERPOOL.**

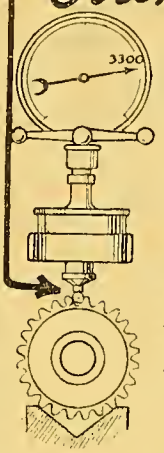
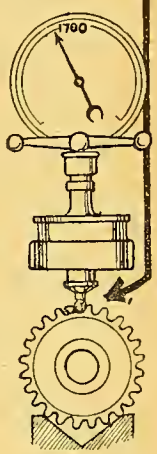
# This is Twice as Strong as That



*Actual test showing new tooth fracturing at 3,300 kilograms — just 100% stronger than the Involute Tooth.*

To prove the thoroughness with which I tackle every repair or replacement or spare part that I undertake or sell, I illustrate a new tooth for the 2¾ H.P. Three-speed Douglas Gear-box. This is just 100% stronger, and yet is no larger than the ordinary type gear. It gives you a large factor of safety, so that if you wish you can add a sidecar to your little Douglas without fear of the extra load fracturing the gears. I have made arrangements to supply the two low gear-wheels at 9/- each; these are the wheels that have to take the greatest loads, and I recommend everyone to fit them. I can supply a complete set of six wheels for 54/-. This price does not include fitting which is 9/- per gear-box. Carriage extra.



*Actual fracture of involute tooth at 1,700 kilograms. This tooth is only half as strong as that shown on the left.*

The thoroughness with which I have solved this gear problem will give you some idea of the attention I give all Douglas Repairs. If you send me your repairs or overhauls you are sure to be satisfied, as I am not content to just replace a part, but want to see that the new part gives better service than the old one. I can entirely rebuild your Douglas, enamelling and plating, in seven days—most other repairs by return Any Douglas Spare Part guaranteed by return of post. Why not have your work carried out now in the slack time, and your bike ready for the Spring, rather than delay it till the busy time with its subsequent disappointments. Remember, I repair any Douglas or Williamson, and repair it honestly. I am an Official Repairer to the Auto Cycle Union. Official West of England Service Depot for E.I.C. Magnetos. Official Agent for Douglas Motor Cycles, and I was 10 years in their works. I am in a position to supply spare parts to any part of the world.

*This illustration shows the new-shaped tooth—black—is very much stronger at the root than the involute type which has a narrow neck like a bottle, making it unsuitable for heavy loads.*

BRAND new Brooks saddle, B.170; 39s. 6d.—Wandsworth Motor Exchange, Ebner St., Wandsworth. [5951

SUNBEAM parts, Gear, Engine, Forks. New secondhand wanted, 1914-15, 3½.—Motor Engineers, 138, London Rd., Dover. [5333

STURMEY-ARCHER 3-Speed Gear Box complete as new, £13/10.—Collins, 20a, James St., West Bath. [5326

1914 Clyno lightweight, complete less unit, £12. Genuine bargain.—Harris, 53, Regent St., Swindon. [5362

INDIAN Spares, vast stock, new and second-hand.—Dennis, the "Indian" Repair Specialists, 89, Brixton Rd., London. [5376

PALMER'S Motor Auction.—Every Thursday, 2 o'clock. Selling commission, 10 per cent. Send those parts and accessories.—Palmer's Garage, Tooting. [5881

TRIUMPH, less power unit, £7. Rex engine, frame, forks, wheels, £3 10s. Triumph engine, £4 10s. Offers. Exchange push cycles.—Tegg, Dorchester Wallingford. [5345

BOSCH Magneto, genuine heavyweight, watertight, like new, anti, £3. Stewart speedometer, complete, new, £2. Not Sundays.—Cheesman, Highfield Garage, Edenbridge, Kent. [5367

J.A.P. Spares, all types; quotations by return; also partly used cylinders, pistons, etc., aluminium valve caps, 7/6 each; inquiries invited.—V. M., 13, Ashmount Rd., South Tottenham. [5378

1921 Senspray Lightweight Carburettor, straight copper exhaust for Scott, 6-volt 40-amp. chloride accumulator, ancient low-tension magneto.—Particulars, Scott, Hillsboro', Westfield, Harpenden. [5387

MISS DOOLEY.—Clyno spares: Please note that I have a very large quantity of these in stock, and can supply cheaper than anyone else. They are all new, and prompt despatch of goods is assured. Try me for prices.—Below.

MISS DOOLEY.—Helmets, Helmets, Helmets. New soft leather lined chamois, with ear flaps and straps, 6/- each, postage free; reductions on quantities. Also new shop-soiled helmets, same style, 3/- each, post free.—Below.

MISS DOOLEY.—New Enfield mudguards, late pattern, front 15/-, rear (in two halves) 10/-, carriage extra.—Below.

MISS DOOLEY.—Patches. Tins of 50 prepared patches, 3/ per tin; reductions on quantities; postage 6d.—Below.

MISS DOOLEY.—Douglas 4h.p. withdrawal bolts, complete, 3/- each, or nut, cone, and washer, 1/- per set.—Below.

MISS DOOLEY.—A few khaki No. 127 P. and H lamp sets left, new, complete with brackets, 35/-; also a few Lucas rear lamps, new, enamelled black and N.P., 4/- each; postage extra.—Below.

MISS DOOLEY.—New Steel Cutters to cut up to ⅛in. Steel. Price 1/6 each. Postage 6d.
Please apply to Miss E. Dooley, 33, Killyon Rd Clapham, S.W.8. [5525

PAIR Triumph Wheels, 45/-; pair wheels 28×3 fitted ⅝×⅜ sprocket and expanding brake, new, 45/-; Brooks saddle, 30/-; Bosch magneto, 50° twin anti, 45/-, 1921 Amac, 1¼in. induction, 45/-; lightweight Amac, new, 42/6.—Kennard, 75, Yerbury Rd., Holloway, N.19. [5386

INDIAN Front Forks, gear boxes, and engines, and all parts for same.—Below.

INDIAN Intake Domes, carburetters, magnetos clutches, kick starters.—Below.

INDIAN Carriers, chains, and guards, springs sprockets; in fact, everything for 7-9h.p.; all parts absolutely new.—Dennis Accessories Stores, 89, Brixton Rd., London. Specialists in Indian Repairs 'Phone: Brixton 3129. [1195

BARGAINS.—Reliable mechanical horns, complete H.B. fittings, very loud, 8/6, postage 1/-.

FOOT Pumps, folding stirrup, long connection, 3/-, postage 9d; above brand new.—Wem Motor Co., Wem, Salop. [4546

GEAR Box, 3-speed and clutch, latest type; price £11/10.—Sinclair, Room 7, 32, Charing Cross, London. [2595

STURMEY-ARCHER Gear Boxes, brand new; in stock.—County Engineering Co., Hounslow [051[illegible]

TRIUMPH Brand New Pistons, complete, 18/6; cylinders with guides, 75/6; exhaust valves, 4/-.—Below.

BACK Carriers, 14/-; silencers, 12/6; back stands, 12/6; chain cases, 12/6.—Below.

BROOKS B150 and B170 Saddles, like new, 25/-; springs, 1/6; Triumph seat-pillars, 2/3.—Below.

SATISFACTION, or cash returned in full.—Harvey's Garage, 47, South Lambeth Rd., S.W.8 (near Vauxhall Station). [4853

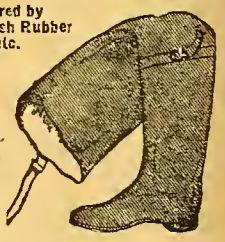
JUST THE THING FOR WINTER

LEATHER JERKINS

These leather jerkins are made from superior quality tan leather. Very soft and pliable, fleece lined and double stitched. They can be worn either over or under your overcoat. These goods could not be produced, even on the present slump prices, at less than 30/- each. Stock is not large, and when cleared cannot be repeated.

**10/- each**
**Postage 1s. extra.**

RUBBER HIP BOOTS
Manufactured by North British Rubber Co., Ltd., etc.



THESE GOODS ARE QUITE NEW AND NOT OLD SURPLUS STOCK

Sizes: 7, 8, 9, 10, 11, 12.

SENT ON 7 DAYS APPROVAL AGAINST REMITTANCE.

Per Pair **12/6** Carriage 1/- Extra.

## A Straw in the Wind.

ONE feature of our pages which is quite an index of motor cyclists' requirements is the section devoted to "experiences wanted."

From the last few weeks it may be definitely deduced that there is a strongly reviving interest on the part of would-be purchasers. One month of the new year only has passed, and we find an increasing flow of requests for experiences of the various machines which our querists are weighing in the balance before making their choice for 1922.

It is to be assumed that practically all making use of this feature seek definite information relating to machines which they contemplate buying. A big increase in the number of such enquiries indicates unmistakably an increasing number of purchases. The inference is to be drawn, then, that demand, thanks to the approach of spring, is once more tending to get back to normal. This view is supported by reports received from prominent people in the motor cycle industry, and it is firmly believed that the tide of depression has indeed turned.

The new situation in Ireland is also tending to improve the outlook. Ireland has always been a great motor cycling country with live clubs and keen sportsmen, and a settlement of political differences will undoubtedly revive the motor cycle movement in that country. In pre-war days a large number of machines were sent across the St. George's Channel, and it is to be hoped that in the near future the Emerald Isle will regain its proper place among motor cycling nations. The youth of Ireland has always been associated with healthy sport, and with the renewed activity of the clubs the old brigade of motor cyclists will be augmented by a large number of recruits. The more satisfactory conditions now prevailing in Ireland are already having the effect of levelling up exchange.

## The Term "Service."

AN essential plank in the platform of every efficient works organisation desirous of building up a lasting business is good service to the buyer.

In the case of an intricate piece of mechanism such as a motor cycle, by nature complicated, highly stressed, and demanding intelligent management (comparatively speaking, be it understood), "service" necessarily becomes something more than a mere selling organisation. It is incumbent upon every works to take a maternal interest in the future welfare of its products, and, perhaps, extend its guardian spirit over many of its clients, if an estimable name in the world is to be regarded as an asset.

The man who buys a machine should have a justifiable belief in his right to expect its almost unfailing readiness to take and use the road; the factory should encourage that belief, and should make it a matter of pride that from its point of view no blame can be attached for any machine being off the road perforce.

If a rider needs an urgent spare part and his machine is unrideable until it arrives, that machine stands idle as a monument to its dependence on the parent factory; each day it is out of commission through delay in the spares service is an evidence of parental neglect. The moving spirit of works spare and repairs departments should be promptness, to keep machines on the road, not to hold them off it.

These things are not thoroughly recognised even to-day; complaints, sometimes of large firms and other times of smaller factories, still reach us, telling of machines held up for want of some small replacement or some minor repair.

In these days, when good service must be fostered, managers should recognise that every machine running on the road is a testimonial—every mount in dock an unnecessary time is a reflection upon the works organisation.

An Index to the advertisements in this issue will be found on the page facing the back cover.

### A Good Waterproof.

IF I had gone to Exeter this last Christmas I should have tried out an Aquamac suit which has resisted some frightful downpours of comparatively short duration in a fashion which inspires confidence. I have no financial interest in it, but feel a certain paternal fondness for it, as its designer took a tip from me and abolished instep straps.

Instep straps, as we all know, turn brittle after a few wettings, and presently come away from the gabardine stuff. So the Aquamac man has substituted chains, riveted to small metal attachment plates very securely fastened to the fabric. He has devised another cunning wheeze, consisting of a concealed rubber tube edging to both coat and trousers. I am not sure that I comprehend the why and wherefore of this dodge. Possibly it is planned to assure a good supply of tubing in the event of a broken petrol pipe or chafed electric cable. But I guess that he knows how in 1921 I paid an outside price for a waterproof suit with the pukka Savile Row cut. After a few weeks, with repair outfits, sandwiches, spanners, spare tubes, spare belts, and other impedimenta in the pockets, this suit looked like nothing on earth. I augur that this pneumatic edging is designed to preserve the shapeliness of the garment. At any rate, it has had such an effect up to date.

### A Novel Lamp Fitting.

THE rider whose only night work consists of occasional long-distance rides is often faithful to the gas lamp. Its chief defect is that in short distance work it occasions us the maximum amount of bother and expense. If I want to ride from Coventry to town, gas is as good as anything else, and cheaper; but if I want to ride five miles, returning some hours later, and I repeat the process several times a week, gas annoys me. There must be a practical motor-cyclist on the Siemens staff, for they have just brought out a novel gadget which exactly meets the case. A grubscrew locks an insulated bracket to the burner support of an acetylene lamp. To this bracket is pivoted a movable arm carrying an electric bulb. The arm has two positions, viz. :—

(1) Horizontal, level with the base of the burner support. In this position the electric circuit is automatically switched "off," and the parts are at a safe distance from the heat of the gas flame.

(2) Vertical, when the current is switched on, and the electric bulb is above the burner, and facing backwards towards the centre of the reflector.

With the aid of this cheap fitting, plus a dry battery in a leather strap-on case, a rider enjoys two options in lighting. He can use gas for his long-distance work, and when he wants to go and see his girl two or three miles away he can turn up the bulb holder and run on electricity.

### Siemens Dry Battery Lighting.

I HAVE been using the above firm's dry battery outfit of late, and in one important respect it represents a pleasant change from the last two electric installations which I have tried. Many outfits utilise bayonet bulbs (known in the trade as "S.B.C.") No bulb will stand up indefinitely on a motor cycle, and in really hard wear a winter's outlay on bulbs can rise to respectable dimensions when replacements cost 3s. or more apiece; the price of these tiny fittings is controlled by a trust. The Siemens sets employ the "M.S.C.", or "miniature screw-cap" type of bulb, familiar to all owners of pocket torches. These bulbs are made for a cheap, popular market, and cost 6d. or 8d. apiece, according to specification. They are correspondingly economical for motor cycle purposes. The Siemens people supply specially good samples in this line, and their dry batteries seem considerably more durable than the imported cells which I used prior to 1914.

### Another "Tramp" Motor Cyclist.

I ALWAYS wondered who bought the "junk" which figures so largely in our small advertisements of second-hand motor cycle bits, and my recent paragraph about riders who constructed or reconditioned machines for their own use out of old parts has brought a perfect avalanche of confessions from determined men who furnish themselves with usable machines for next to nothing. The latest is from a Durham reader, who procured a 1914 Humber of 3½ h.p., fitted it with a water-cooled cylinder off a Humberette cyclecar, mounted a Scott radiator between the bicycle and sidecar, and then proceeded to camp all over the North of England with a load of some 30 st. He thinks nothing of taking Kirkstone Pass in one piece, complete with tent and cookers on board.

### Down a Long Hill.

EVERY competitor in reliability trials is familiar with the anxiety of trying to prevent sparking plugs from oiling up during the descent of long, steep hills. For example, in the 1921 "Six Days," all the boys were worrying all the way down Countis-

**Occasional Comments.—**

bury as to whether their plugs would be foul at the foot, just before they commenced the climb out of Lynmouth. If experts have to study the point, one can guess that the average amateur often fouls a plug when he is touring in mountainous districts, especially when a heavy sidecar is concerned, and a low gear must possibly be used against compression to assist the brakes. The point is a small one, of course. It seldom worries me appreciably, as a solo man can keep his exhaust valve up, and so prevent oil being drawn up past the piston rings; but some of my sidecar friends complain rather loudly of plug-fouling down long precipices. A Surrey reader has patented a device for curing the trouble, and further claims that his gadget is an aid to cooling. It consists of a tiny automatic air valve, intended to screw into the exhaust valve-cap (which must be bored with sparking plug thread). The spring is adjusted so that it opens when the throttle is shut, but remains closed when the throttle is open.

### An o.h.v. Tool.

A FEW weeks ago I commented on the problem which the removal of overhead valves presents, especially when very strong springs are used. The paragraph was inspired by a friend, who had constructed a sort of wooden sugar loaf on to which he slipped his dismounted cylinder like a thimble on a finger. Even then he found my aid invaluable in compressing the spring sufficiently to allow the cotter to be extracted. *A fortiori*, to change a faulty spring or a dubious cotter without removing the cylinder is generally all but impossible. All that is going to be changed. At least one of the leading firms interested in o.h.v. engines has conceived a practical sympathy with amateur mechanics handling their engines, and is patenting a tool which will meet all emergencies.

### Two Engines on One 'Bus.

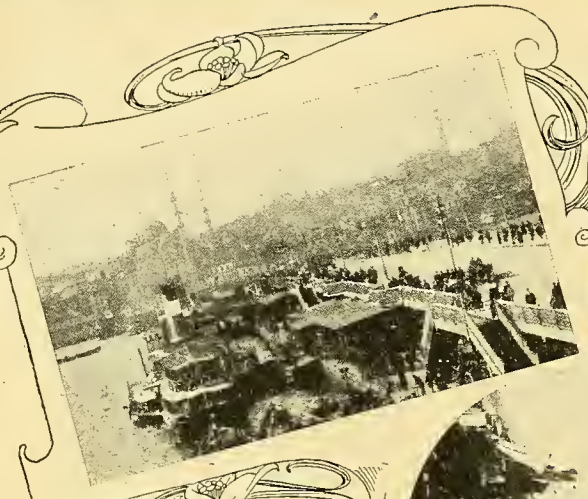
A READER of my "Reminiscences" revives the past by resurrecting in memory the original 5 h.p. Quadrant tricar, which had *two* 2½ h.p. single-cylinder engines, each driving by its separate belt its own rim affixed to opposite sides of the rear wheel. He bought this quaint beastie because his previous machine—a 2¾ h.p. quadricycle—had struck him as rather underpowered. But he found it difficult to induce the two engines of the tricar to synchronise. I should think so. My own experiences of the Quadrant tricar were confined to the first 1½ h.p. model, on which I once proceeded through Manchester hitched to the tail of a hansom cab by means of my own belt (twisted bootlace variety). I added greatly to the gaiety of a grey city on that day.

### What is a Slump?

TWO traders told me recently that they couldn't understand all this talk of a slump during the past year. One was an agent, living in a rural townlet of 2,000 inhabitants. Since last February he has sold twelve Morgans and twelve new Triumphs, besides a number of reconditioned W.D. 'buses and other second-hand stuff. The other was a small maker, whom I never suspected of building more than ten machines a week. He laid his hand on his heart and assured me that his output has averaged thirty.

A SCENE ON THE MAIN ROAD TO THE HIGHLANDS. It is rare to find a sidecar in this isolated district, near Carrbridge, when the snow lays thickly on the ground.

# In and Around Constantinople



The meeting of East and West—Galata Bridge across the Golden Horn

Looking down on the Bosphorus. The Asiatic shore in the distance.

A street in Stamboul.

"I was the daughter of Imperial Rome,
Crowned by her Empress of the Mystic East."
—*Selwyn Image.*

THERE are various semi-platitudinous sayings whose extreme truth one only realises by bitter experience. When I left England four months ago I disposed of my beloved machine and determined to do without a mount during my stay in Constantinople, but it was not long before I realised that "once a motor cyclist always a motor cyclist" is no idle saying.

### Irresistible Urgings.

At first it was not so bad, there was so much to be seen and done; then I took to stopping and looking round at every motor bicycle that passed me in the street, and, if I saw one leaning on the kerb, it was as much as I could do to restrain myself from leaping on it and driving away.

Then one day I saw "Harold."

"Harold" is really only a rather ancient Triumph, but his individuality is such that he simply had to be given a name of his own. He was standing in a dark corner of a garage near the Taxim Gardens, wedged tightly between a pre-pleistocene Wanderer and an Indian sidecar that had seen better days. He himself, I must confess, looked somewhat seedy. His front tyre was flat, dust coated his upper works, and his handle-bars drooped dejectedly. However, when cajoled into the full light of day, his shabbiness appeared to be due rather to dirt and environment than anything else, so, as I could find nothing drastically wrong mechanically, I arranged to have a trial run next day.

When I arrived at the garage, "Harold" stood forth resplendent—really, I should hardly have known him except for his somewhat quizzical air, due to a bent front mudguard. There were no numbers fitted at all. On enquiry about this I was informed that these were really quite unnecessary; certainly, a few more conscientious citizens painted on the first number that came into their heads, but the vast majority were content with none at all.

"Harold" started easily enough and we bumped away over the vile *pavé* towards Mashlak. At this period there were several broken balls in the steering head races, which made the steering somewhat stiff and difficult—in fact, just at first, before we got used to each other, I was none too happy. On the whole, however, I was very satisfied with the result of my trial, so "Harold" became my property to "have and to hold" for the sum of 220 lire, which, at the present rate of exchange, is about £33. As the machine is a 1917 model, in really capital condition except for one or two details, I consider this very moderate.

Motoring out here is a very different proposition from what it is in England. The roads are, almost without exception, atrocious, even those that pass as being very fair would be considered almost impassable at home. The streets of Constantinople and its suburbs are *pavé*, and anyone who has ridden in France knows what that means!

### Leaving the Road for Comfort.

In the country the main or military roads were, presumably, once properly made. I say "once" advisedly, as I should imagine that since their original

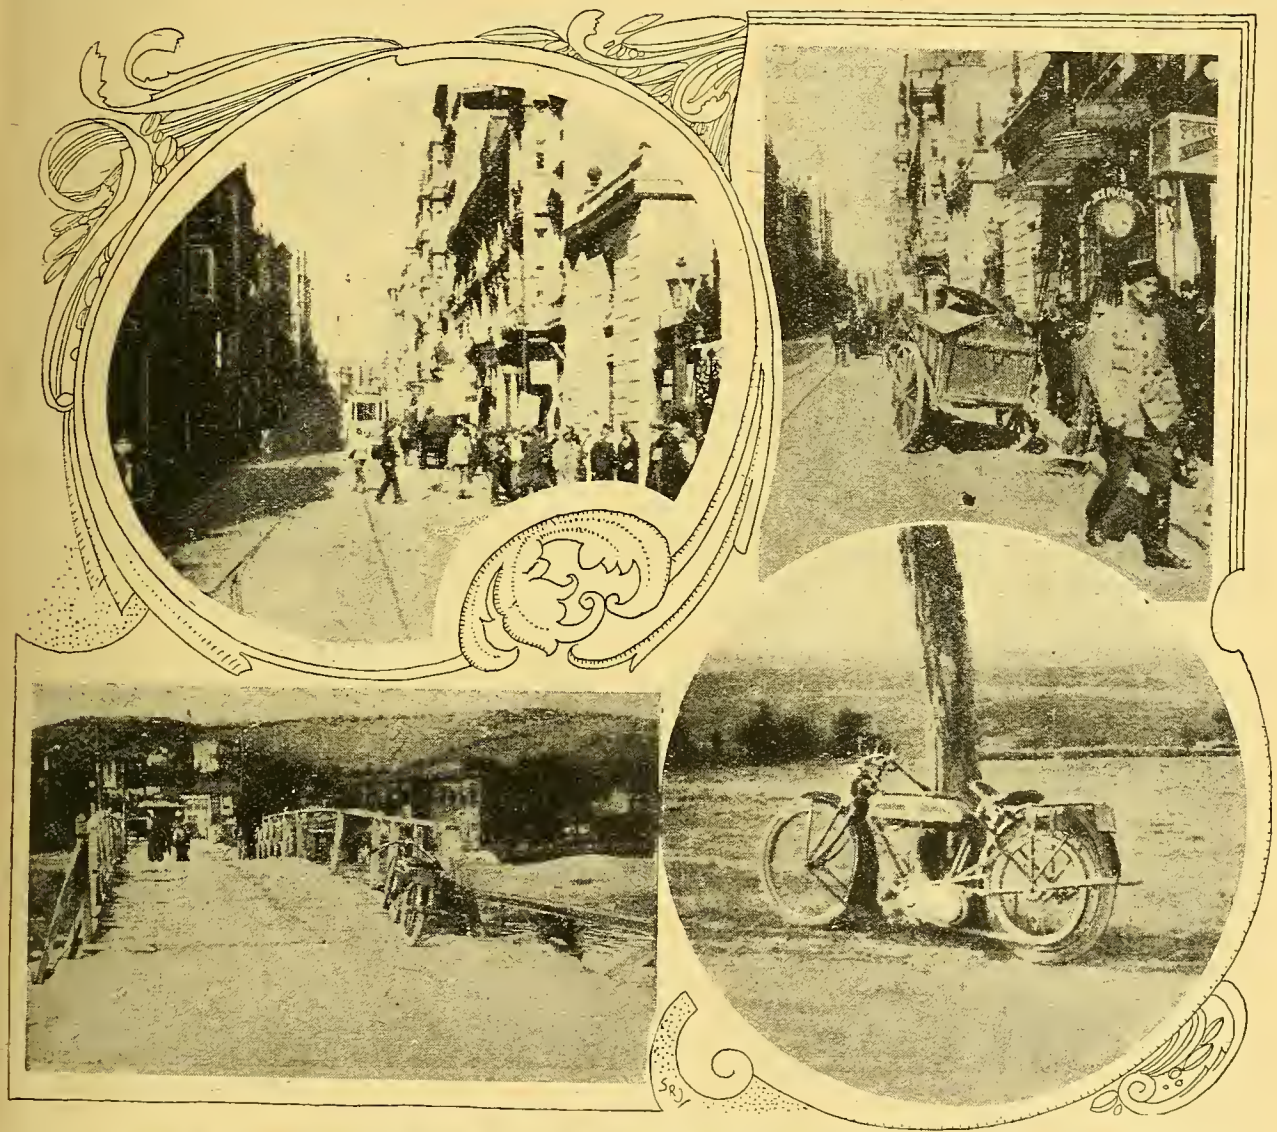
construction they have remained untouched, but, unfortunately, not undisturbed. In some cases the traffic has left the main road and rolled a track for itself alongside of it, these tracks being infinitely preferable to the road, for, whereas riding on the track may be compared to being in a small boat in a choppy sea, riding on the main road is what I should imagine it would be like in a square-wheeled unsprung lorry driven furiously long the Devil's Causeway. The country roads are, in winter, a sea of mud and impassable to motor traffic; during the summer they dry into a series of ridges, lumps, and ruts, and are only just rideable.

### British Machines on Bad Roads.

Considering the really bad condition of the roads, I think it is remarkable the way motor traffic of all kinds stands up to its work. I would like some of the numerous critics of the so-called "machine smashing trials" to see the way in which motor cycles are driven, every day and all day, over surfaces a great deal worse than those included in many of the more vigorous trials, such, for instance, as those run by the Ilkley Club. It is very gratifying for a Britisher to see that practically all the machines in use out here are British made—mostly Triumphs. Apart from Triumphs the only other makes I have seen are a couple of Rudges, a Douglas, two Indian sidecars, and three very primitive-looking Wanderers; doubtless there are others.

### Turkish Delight!

The Turk is not as yet much of a motor cyclist, but this is probably due to financial inability more than any lack of keenness on his part. On one large open space in the town one may hire a Triumph and "lap" the ground. The charge is twenty-five piastres a "lap," or about a shilling. This form of amusement is well patronised by the Turks, and suggests possi-



(Top) Scenes in the main street of Peva, the modern or European suburb of Stamboul. (Bottom) A Turkish village on the Bosphorus, and a typical view of moorland beyond Constantinople.

bilities for the amusement caterer in the seaside resorts in Great Britain. Of course, the "course" would have to be on private ground, otherwise the authorities would insist upon each rider taking out a licence. Scooters or de-tuned lightweights would fill the bill.

The difference between the riding of a British despatch rider from the G.H.Q. and a Turk is very pronounced. The Britisher slips quietly and quickly through the traffic and in half the time the Turk takes, although from the noise and expression of concentration of the latter, one might imagine him to be the faster of the two.

### Beautiful Country.

"Harold" and I have had some very pleasant times together, for, although riding itself is not much of a pleasure, owing to the state of the roads, the country round about is most beautiful. At the back of Constantinople there are miles and miles of moorland, strongly reminiscent of Scotland, and, in the autumn, purple with heather. After being bumped to a jelly for miles it is very pleasant to dismount and sit on the shoulder of some hill that overlooks the Bosphorus. Below, the heavily-wooded steep hillside runs to the edge of the blue water, and across, only just over a mile away, rises the Asiatic shore. Clinging to the hillsides and spreading up the valleys are the little brown and white villages, each with the slender white finger of its minaret pointing skywards.

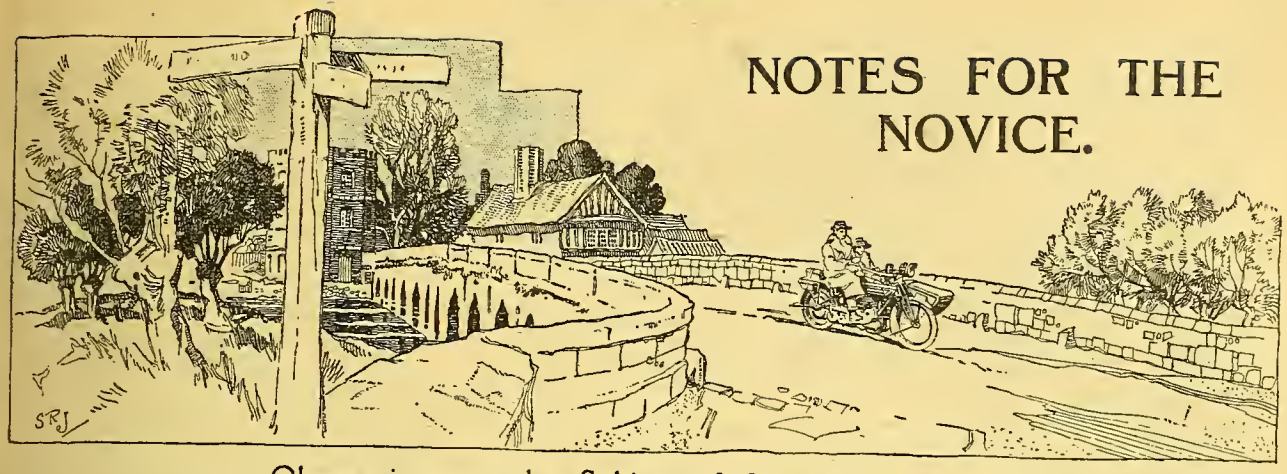
The atmosphere is so wonderfully clear that the greens, purples, and browns are almost radiant.

I have as yet done no motoring on the Asiatic side. I do not expect I shall either, as I hear that the roads are even worse than they are this side, and inland there are many large dogs that are unaccustomed, and consequent antipathetic, to strange forms of locomotion. There are also brigands.

### A Cosmopolitan Crowd.

Constantinople is a most interesting, romantic, and beautiful town, but it is not much of a place to ride in. It is probably the most cosmopolitan town in the world at present—Turks, Greeks, Armenians, Russians, British, French, Italians, Americans, and a score of other nationalities throng the streets. Unfortunately, they overflow the pavements and step under one's front wheel with the most nonchalant air in the world. The streets are very narrow and crowded with trams, gharries, motors of all sorts, ox carts, and even camels. The Turkish policemen on point duty, carry a miniature barber's pole about two feet long with which to threaten or cajole the traffic, which they really regulate very well. Petrol is of good quality and price about 2s. a gallon, oil 1s. a kilo. W.S.J.

MOTOR CYCLE SLEDGING IN AMERICA. This magnificent sheet of ice, Lake Hopatcong, N.J., has been utilised to the fullest extent by motor cycle enthusiasts. It will be observed that the machines are fitted on to the sledges minus the front wheel, the rear wheel being shod with spikes to propel the vehicle along.



# NOTES FOR THE NOVICE.

## Observations on the Subject of Sidecar Alignment.

IN the old "bath chair" days of the sidecar, just over a decade ago, there were some few excuses for the examples of faultily lined-up attachments which were to be seen.

The sidecar then was a simpler vehicle, but it had not the convenience of quickly detachable couplings, its attachments lacked rigidity, and there was not the high proportion of sold-as-a-unit outfits which are now obtainable; yet even to-day a trip on the road cannot be undertaken without encountering an occasional example of appallingly bad sidecar alignment.

### A Common Defect.

Machines leaning in upon the sidecar to an alarming degree are still to be seen on any road used by the ubiquitous sidecar—a degree which is real although it is not readily apparent to the eye of the passer-by; while complaints of uneven tyre wear indicate that many sidecars are wrongly fitted.

Yet there is nothing mysterious, nothing intricate, nothing problematical about the manner in which a sidecar should be attached, nor about the actual operation of attaching it in the first case. It is merely necessary to remember that:

*(a)* The motor cycle must be vertical or inclined outward slightly.

*(b)* The sidecar wheel must be vertical.

*(c)* The sidecar axle should be level with the rear wheel axle, or slightly in advance of it.

*(d)* The sidecar wheel should be parallel with the motor cycle.

There are riders who disagree with item *(d)* and prefer to have the side wheel pointing slightly inwards.

Whether the sidecar wheel should be level with, or slightly forward of the rear wheel, is a matter for the individual rider to decide for himself. In the forward position, there is a greater tendency to lift on left-hand turns (not noticeable, perhaps, on the heavier outfits, but worthy of consideration with the lighter types, to which these notes, intended for the man who fits his own attachment, must mainly refer). On right-hand bends, however, it gains in ease of steering.

Now, to turn from theory to practice, there are two essentials to easy and correct sidecar alignment while actually doing the job. One is a perfectly level floor, and the other is at least one assistant. Also, it is necessary to borrow two long straight-edges (over 6ft. long, if possible). A friendly village joiner might oblige. Also, borrow the family tape measure, and (if it is too short to cut in two!) another from next door. By means of drawing pins, attach a tape to each end of one of the laths, taking care that this is done uniformly. Finally, devise some sort of plumb-line—not a difficult task.

These preparations made, attach the lugs to the cycle frame, leaving the adjusting tubes just sliding loose in their sockets. Now prop the machine firmly (not on the stand) in a perfectly upright position; do the same, approximately, under the sidecar chassis.

The assistant may now start operations with the straight edge, holding it low down, but horizontally, and bearing at four points on the front and rear tyre walls. (Tyres should be board hard.)

With number two straight-edge against the sidecar wheel, the latter may be "wangled" so that the tape-measures complete a perfect rectangle. It may be worth while marking off the plain straight-edge to an equal length as the distance apart of the tapes on its fellow: but the eye can generally judge this. Check again for vertical movement, and gently tighten up.

### If the Thing is Worth Doing—

We might be even more detailed in our directions; but commonsense should fill in the blanks, and adapt them to varying conditions. But one word more before we leave the subject—if something slips (it often does) after half-an-hour of tortuous endeavour, or if a final test shows that it is not "just so," do not be content; try again. Perfect alignment is worth a lot of trouble.

In our remarks we have taken it for granted that the machine itself is in track, and that the wheel bearings are sound, for it must be remembered that these factors have a direct bearing on final results. Rigid frame machines and rigid sidecar wheels, also, are primarily referred to, for other considerations enter into the case when either of these wheels is independently sprung. For example, when the passenger enters on some makes of sidecars so constructed, one or other of the wheels immediately tends to lean inwards. The same thing often happens when the driver mounts a spring framed machine. But whether it is better to carry out alignment under load in such cases is a matter upon which it is advisable to consult the makers.

# WHAT I RODE IN 1921.

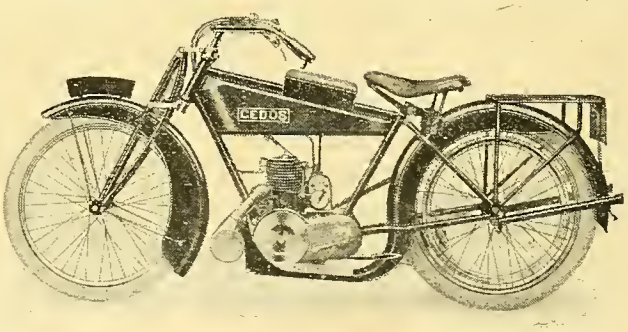
BY 'IXION'

## Experiences of Some Diverse Machines Told in Brief.

THE year 1921 was not a pleasant financial one for motor cyclists. We bought dear, and we sold—if, indeed, we were able to sell at all—quite abominably cheap. Consequently, like all wise men, I limited my purchases as far as possible, and depended, as far as possible, for new experiences on Press trials. The trade was producing plenty of new stuff, and was anxious for publicity; so my note-book reveals that I sampled the paces of some fifty different bicycles, sidecars, and cycle cars for periods of varying duration. I select for serious attention four machines which I either owned or used for over 2,000 miles apiece.

All my hackwork was performed on a baby two-stroke, a 2½ h.p. Cedos. There are so many machines of this type upon the road nowadays that I dare not acclaim my selection as the absolute best; but if there is a better machine in this class, I shall be very happy to make its acquaintance. Its reliability is absolute, no trouble of any sort or kind resulting from a full year of daily hard work, coupled with the most brutal neglect; an occasional sooted plug or choked jet were the sole blots on its faithful service, and these trivial items must rank as inevitable, whatever one owns.

Its power is quite up to the standard in this class, 45 m.p.h. being obtainable on top gear, whilst main road hills create no anxiety on bottom. Its two chief features are its extraordinary comfort and cleanliness. Devoid of oil leaks, thanks to perfect machining and fitting of all joints, it remains almost equally virgin of road stains, thanks to a light, substantial, and admirably designed underscreen, good mudguards, and efficient leg-shields. The under-shield on the Cedos is a forward extension of the rear mudguard.



A two-stroke that delighted our contributor—the 2½ h.p. Cedos.

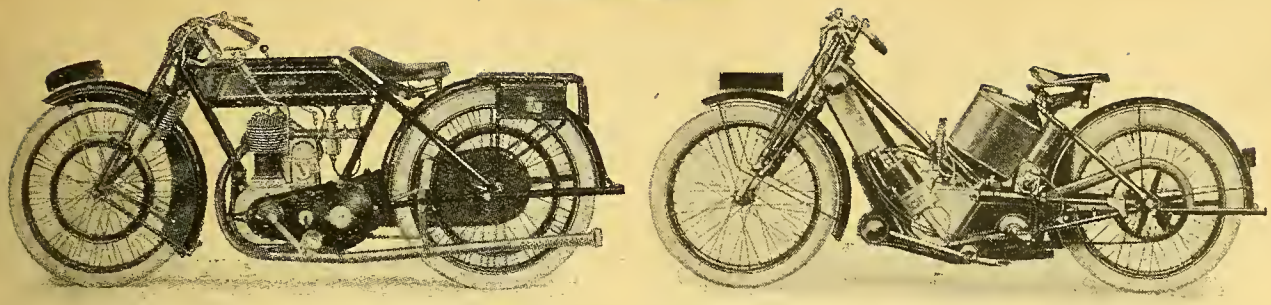
I frequently rode it in tennis flannels, in good tweeds, and even in black Sabbath garments—tests of which few motor cycles are worthy. Its comfort demands a more technical analysis than I have the knowledge to execute, and I have never owned a lightweight which I cared to hog over bad roads as I hogged this Cedos. The one and only criticism which I can pass upon it is that its carburetter was never worthy of it; the fuel consumption was too high—just under 60 m.p.g—and the response to the control levers was never the same on two consecutive days.

### A Sporting "3½."

Next in order of gratitude I must rank a sports Sunbeam, specially geared rather low to compensate for my clumsy driving in freak trials, and to permit of sure climbing when a neglected engine dropped a little tune. If this machine had ever stalled me by the road, I should have felt the same amazement as if the sun failed to rise one morning. It inspires the most supreme confidence, evincing a quite remarkable freedom from even the pettiest stoppages or sulkiness. Its middle gear would take a really clever rider anywhere, for the engine develops tremendous power, and, unlike some "revvers," it can pull uncommonly hard at quite low engine speeds.

A little bit inclined to be rough and coarse at its most hurried gaits, I did not press it in the way of speed, but at high touring speeds it ran very smoothly. Its main fault was the location of the gear quadrant, which had a sharp corner just where one's knee palpitated on bad going

The Sunbeam engine



3½ h.p. Sports Sunbeam and the Scott Squirrel, both of which gave good service last year in the hands of "Ixion."

still lacks a fitting which must some day become universal on roadster mounts—a variable jet, preferably equipped with handlebar control. I find that a sports 500 c.c. seldom averages more than 50 m.p.g. if it is driven hard on the single jet inserted by the factory tuner. It is absurd to fit a fixed 100 m.p.g. jet, which promptly robs the engine of all the vim and vigour constituting its special charm. But if a W.S.R. or Sutton & Pocklington device is incorporated, the mileage per gallon rises to 70 or 80 on the fastest runs, for the big jet opening is only needed uphill.

### A Two-Stroke Twin.

My pleasantest speed experiences occurred on a Scott Squirrel, which is one of the most refined mile-a-minute 'buses on the surface of the earth. Two factors contribute to the delight of its hurry. The first is the well-known Scott frame—not forgetting the fork. As all practised riders are aware, the glutinous qualities of the Scott chassis—whether in speed cornering or in mere tearaway dashes over moorland tracks or pot-holed tar—are the envy and the despair of nearly every rival designer. For comfort, steering, and safety, it is as nearly peerless as any competitive article can hope to be; and it is obviously useless to own a super-engine if the frame makes you nervous about opening the throttle except on those rare occasions when you find a perfect road in perfect condition. Secondly, the torque of a twin-cylinder two-stroke is so smooth that the Squirrel's speed does not set you wondering whether a crumpled connecting-rod is going to emerge sideways out of the crankcase at any moment; and the high gear ratio permits you to touch railway speeds without revving the engine up to its kicking point.

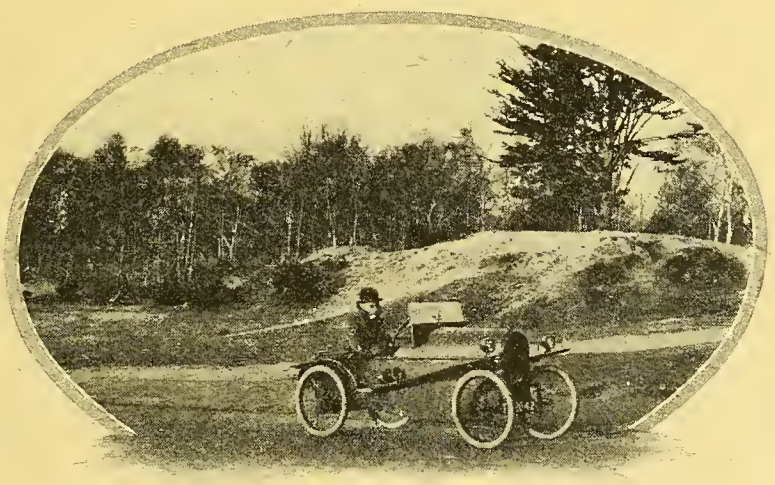
### On Four Wheels.

The last machine is in quite a different category, being a 7 h.p. Carden cycle car. This is the quaintest little beast. It really consists of an auto-axle and a forecarriage. All the power unit is balanced like a seesaw across the solid rear axle, and the rest of the chassis is a mere projection, carrying the passengers, front axle, and petrol tank.

But, my sainted aunt, how it goes! There can hardly be anything on four wheels which does so much work on top gear, and there are very few motor vehicles which run more sweetly at about 35 m.p.h. The whole outfit costs less than a good many motor bicycles, so that one does not expect roomy coachwork, or ample luggage capacity, or notable refinement of detail. On the other hand, nothing falls off. Nothing breaks. Nothing goes wrong. The little beetle-nosed projectile bobs about ordinary roads just as fast as anything else could do, and is quite as reliable. You only feel dissatisfied with her if you adventure into precipitous areas, where the low gear ratio may prove too high, or if you challenge more powerful projectiles along level straights. She is perfectly content to be treated like a door-scraper. Oil in the box above the engine and petrol in the tank under her snout is all she asks for. Give her those, and she will serve you loyally for a year and a day without complaint.

Extraordinary value for money must be my verdict upon her. I dare not say that there is very cosy accommodation inside her for two big people.

On these four machines the bulk of my 1921 mileage was accomplished. Of others which came into my hands for such beggarly distances as a few hundred miles there are several which I hope may figure twelve months hence in a page headed, "What I Rode in 1922."



A small four-wheeler used by "Ixion" as his passenger machine—the 7 h.p. Carden

In conclusion, I commend two gadgets to the observation of the faithful. One is the well-tried W.S.R. variable jet, which should nearly halve the petrol bill of any hard rider. The other is the B.T.H. Sparklight set, which gives no trouble, and furnishes ample illumination for a lightweight machine.

# LAKE VYRNWY

On the road round the south shore of Lake Vyrnwy.

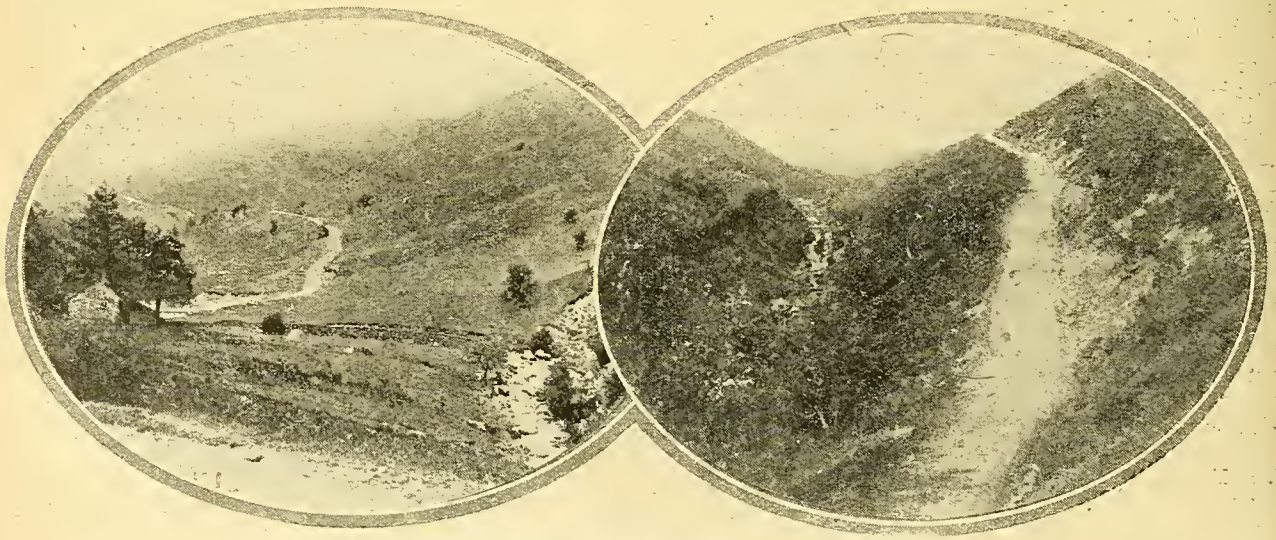
Lake Vyrnwy Hotel, situated in an ideal position overlooking the lake.

## An Unspoiled Beauty Spot in Central Wales.

IN the very heart of the Berwyn Hills of Central Wales there lies, concealed and secluded, a neglected lake. The word is used comparatively, for, while thousands of motor cyclists are familiar with North Wales, with its passes and lakes and peaks, very few have had any acquaintance with Lake Vyrnwy (pronounced *Vern wee*).

The difficulty of access is perhaps the main reason of this negligence, and Vyrnwy is never advertised. No one is ever urged to go or tempted by glowing descriptions and attractive posters. But those who penetrate to that quiet hollow of the mountains are made wonderfully welcome.

The easiest approach is from Llanfyllin, on the border of the great Shropshire Plain, and the road runs almost due west right into the hills. From Shrewsbury the Welshpool road is followed for some four miles, then a side road leads to Llanfyllin, but it is not till the neighbourhood of Llanymynoch is reached that the name of Vyrnwy appears on the signboards. At Llanfyllin the hills are touched, and the roadway thereafter winds about the valley and climbs the slopes of the hills with little more purpose than that of reaching Vyrnwy somehow and some time; but the scenery is magnificent if the going is somewhat rough. Gradually the way rises, steeply at times, till



TWO LITTLE-KNOWN OUTLETS FROM LAKE VYRNWY.

A portion of the Bala Pass which leaves the lake at its northern end, and entails heavy going.

The way from Vyrnwy to Dinas Mawddwy, emerging at the top of Bwlch-y-Groes.

Lake Vyrnwy.—

the highest point is gained, whence there is a grand vision of the wide hills, and far away westward the shimmering line of the lake under the guardian majesty of the Aran Heights.

From this point there is a long downhill run of a mile and a half, with a sharp bend near its centre; thereafter a slight rise to the lake.

### First Sight of the Lake.

Should the visit be made after days of heavy rain, or when a westerly gale is piling the waters against the dam, the roar of the plunging cataract will be heard long before the lake itself is reached, and the sight is a memorable and impressive one, as the torrent leaps down a sheer fall of a hundred feet to the valley.

A roadway crosses the dam and encircles the lake, a run of eleven miles. This circuit should be made at leisure, for the changing scenery as the western head of the lake is neared is very beautiful. On the return toward the east, the Lake Vyrnwy Hotel is seen high on the hills above the dam. This is the only hotel in the district, although some accommodation may be secured in the little village of Llanwddyn in the valley. The hotel is choicely situated, with a long gradual climb from the road at the lake side. Perhaps the finest view of the lake is that obtained from the terrace in front of the hotel.

While sunny weather adds immeasurably to the pleasure of a visit to Vyrnwy, stormy days reveal a beauty of grim and sombre majesty that repays the sacrifice that otherwise the storms demand, and full streams from the hillsides and down the western valleys carry with them their own reward.

From this mountain hollow there is a quite passable escape over the hills to Lake Bala. It is steep in parts, narrow, and far from straight, but with ordinary care may be safely negotiated. The rough surface and the water channels that intersect the path are the most adverse features. These channels are worse on the descent to Bala.

More southerly yet is another outgoing from the Vyrnwy valley to the summit of Bwlch-y-Groes, a wilder and more strenuous way and wisely regarded by most as impossible; but it is a way all the same, and some have had the temerity to take it, with varied results. This route was taken by competitors in the M.C. and A.C. trial of 1920, and was marked on the route card as Boydell's Playground.

To see Vyrnwy to the full one must linger there and be content to leave the road and make excursions on foot up the watercourse at its western end or over the hills to the east.

The building of the dam that created this lake is an instance of man's improvement over nature's work, or, rather, man's co-operation with nature in working improvement schemes, both to the advance of natural beauty and the utility of man. ALLAN PHILLIP.

IN THE HUNTING FIELD.

An animated scene at a recent Midland meet to which a big number of motor cyclists journeyed. Many of them afterwards followed the fortune of the field from the by-roads and lanes.

# MAP READING FOR MOTOR CYCLISTS.

## An Occupation for the Sidecar Passenger—Use of the Compass.

LOSING the way in foul weather and in a strange land is one of the most trying experiences that can fall to the lot of the motor cyclist. Asking the way is humiliating, to say the least of it, and in nine cases out of ten leads to further bewilderment. Official guides are useful folk, doubtless; but you do not find them at every signless road-crossing. Personally, I do not think I have come across a score of these gentlemen in the course of ten years' touring.

Touring without maps is almost as shiftless as navigating without charts. Plotting out a tour is, or should be, a preliminary pleasure; when actually on the road, the use of the map is a source of continual interest.

First, as to the choice of these necessary things.

For general purposes (*i.e.*, for merely getting about) one cannot do better than buy the Bartholomew "half-inch" and make free use of the scissors to cut up the sheets so that only those portions which cover the district in which one is immediately concerned are carried.

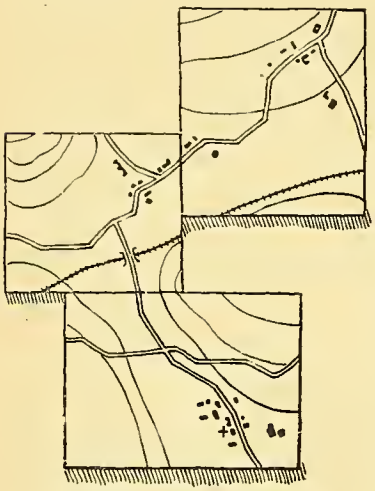


Fig. 1.—Map sections set to cover district under survey.

I find it convenient to mount these pieces on cardboard: they can be referred to in stormy weather without trouble, cannot be torn, and are readily placed side by side to get a continuous plan of the route (fig. 1). The "one-inch" Ordnance Survey, on cloth and in sections, is useful for short runs, but unmounted paper maps are quite uncontrollable.

### Maps in Sections.

Next, with regard to the use of maps on the road. The sections can be carried in a map-case of military pattern, slung round your shoulders; or, if on cards as suggested, in an ordinary satchel. (A set of useful road maps on cloth and in a case is published by the proprietors of *The Motor Cycle*.) Should a sidecar be used, with an intelligent passenger, the maps may be handed over to him (or her) to point out the route.

Finding one's position on the map is generally easy enough, except in fog or rain. The map should be "set"—that is, so placed that one is looking along the chart in the same direction as that in which the journey is being made. This is done either by means of a compass or by recognition of objects seen on the ground and on the map at the same time. Fig. 2 shows a village A, a wood B, and a hill C, as they appear to the observer; and fig. 3 gives the same objects on the map. In order to get the identical point of view, in this example, the map has to be reversed. The top of the hill and the village church give a rough alignment.

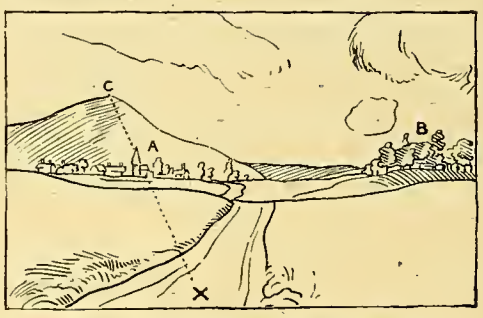

Fig. 2.—The motor cyclist's view of the section shown in fig. 3.

But in the case of a shut-in turning or cross-roads, not easy to identify on the map, a compass will be useful. We are bordering here on the more advanced stages of map reading, but the war has taught a vast number of people how to use this instrument, and the motorist will find it a valuable asset.

### Accurate Observation.

Generally speaking, a careful look-out should be kept, on map and road, for churches, bridges, rivers, railway lines and stations, canals, and post offices. The names of the towns and villages through which one intends to pass should be written down, with the distance between each. A card with this information clipped to the handle-bar is often very handy.

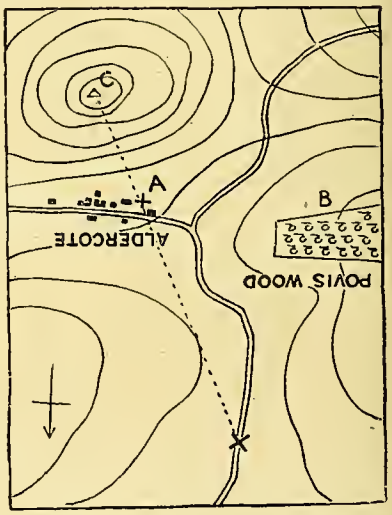

Fig. 3.—Depicts the perspective view, fig. 2 in plan form. The rider is travelling from north to south, hence the depicting of the map upside down.

For arranging a tour beforehand, the new "Popular" edition of the one-inch Survey is an excellent guide. The system of road-colouring is very clear, and the solid blue of the rivers is an improvement. Contour lines are at 50ft. intervals. These lines are somewhat faint, and it is a sound plan to mark them with red ink where they cross any of the roads you are examining. Fig. 4 shows the method in use. The road A is intersected by widely-spaced contours, and,

**Map Reading for Motor Cyclists.—** to drivers of under-powered machines, is, therefore, preferable to the road B, where the lines are close together, indicating a stiff slope.

If the tour is to cover a wide area, the coloured Bartholomew map is the best for getting general schemes and comparisons. The tinted levels give a pictorial impression of the country, thus enabling you to make a rapid choice of roads. Third-class roads, except for short distances, should be avoided, as should big towns in manufacturing districts.

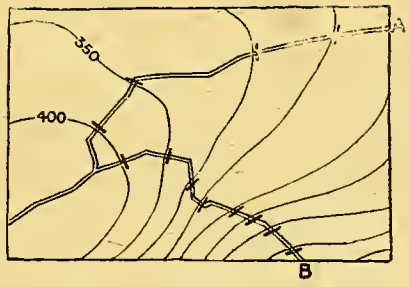

Fig. 4.—A contoured section, which reveals that road A has easier gradients than road B.

One should try to memorise maps—to get the general lie of the land, at least, in mind, together with the names of the principal villages and towns. Important turnings should be remembered.

These suggestions apply only to the use of maps as road guides. I would recommend to all motor cyclists the advanced study of the subject—a study of endless fascination and resource. Map reading is being popularised at the present day by means of several excellent handbooks. C.E.V.

# A GARAGE IN THE HOME.

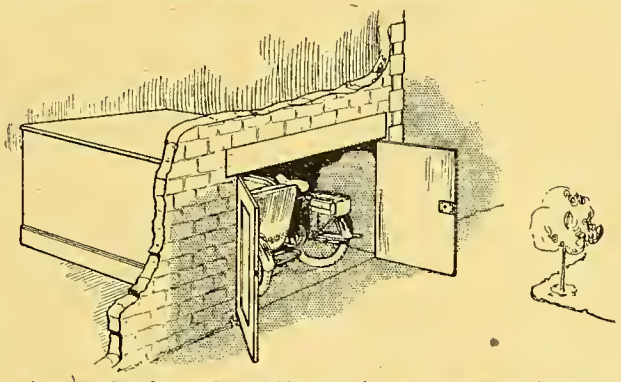
## An Unusual Solution of the Storage Problem—But What will the Housewife Say?

ONE of the greatest drawbacks to the passenger motor cycle is the difficulty of finding suitable housing for it. It is admitted that a machine which is kept a long distance from its owner's residence is not used so frequently as another which is "on the premises."

Especially is this the case in our large cities, where all kinds of expedients have to be resorted to in order to find stabling for one's steed, at home or otherwise.

The writer claims the following as a practical and inexpensive solution of this problem, suitable in many cases where an independent shed is out of the question.

Briefly, the idea is to form a cupboard in the house itself, with access from the outside only. In the first place, a lintel should be prepared. This should be 6ft. long, and may be either of wood, stone, or concrete. It should be the full thickness of the wall (which would probably be 9in.), and if of wood it may be in two lengths, each 4½in. wide.



A suggestion for storing a sidecar at home where space forbids a garage at the side or back of the house.

The brickwork should then be cut out to receive the lintel. This may, in most cases, be done without any props, providing the wall is fairly well built. It will be found most convenient to make the lintel about 7in. deep, and this will occupy the place of two courses of bricks. After this is once fixed and wedged up tight, the brickwork below may safely be taken out, but care must be taken to leave 4½in. under each end of the lintel.

### Practically an Amateur's Job.

The only part of the work which could not be readily done by any handy man is the door and frame. These should be prepared beforehand by a joiner, and should be 1½in. panel doors, fixed to a frame constructed of 3 × 3in. timber.

Having obtained these from a local joiner, the work of fixing them is very simple. In order to obtain as much room as possible, the frame should be fixed flush with the outside wall and well nailed to the brickwork. Hang the doors with 2½in. butt hinges and fasten one leaf of the door with a bolt down into the floor on the inside, and fix an ordinary door lock on the other half. This completes the outside work. It is perhaps unnecessary to remind the amateur builder that careful and good workmanship is very desirable, or that several coats of good paint is a necessity.

Inside the room the cupboard may be made to suit individual taste and the purpose to which it is proposed to be put. If expense is the chief consideration the work should be carried out in match boarding ½in. thick. The finished height above the floor being only 4ft., the top can be made to serve as a table, writing desk, or any useful article of furniture.

If something more ambitious than match boarding is required, the end and side might be formed of panels, as in the illustration.

Of course, many variations of this idea will occur to the reader. For instance, the cupboard might be made to stand partly inside and partly outside the wall, so as not to occupy so much space in the house. In that case the part projecting outside the wall would require felting to make it weatherproof, while inside it could form the lower half of a bookcase.

In other cases the recess formed by the fireplace may be used with advantage.

It will be found to be considerably cheaper than erecting an independent shed, but, of course, there is the property owner to consider. If the house belongs to the occupier there will be no worry on that score, and if the occupier is a tenant only, he should obtain permission from the owner before starting the work.

It would help to facilitate matters if the tenant gave an undertaking to build the front opening up if called upon to do so, and leave it exactly as in its original state.

# IDEAS: USEFUL AND INGENIOUS

A Selection of our Readers' Home-made Gadgets, with some Practical Hints on Work in the Garage, by "Wharfedale."

**Hints, Tips, and Descriptions of Home-made Fitments are invited for inclusion on this page. Rough sketches and brief notes only are needed, and payment will be made for all matter used. Letters should be addressed to the Editor, Dorset House, Tudor Street, London, E.C.4, and should be marked "Ideas."**

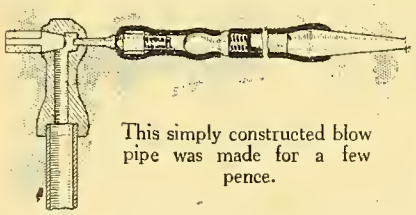
ALMOST every rider once a year makes some little gadget, originates some method of performing an operation, or discovers a new use for an everyday preparation which would be of interest to, or effect economies for, his fellow motor-cyclists.

As a case in point, I accidentally broke a cheap vulcanite adapter plug for an inspection lamp the other week. The spring contact plungers were laid bare, and the whole thing was "rocky." A twopenny stick of Prout's elastic glue from the saddler's shop provided the material for remoulding the part broken away. This preparation sticks most things together, is flexible, can be moulded with the fingers when warm, and is a non-conductor. Sealing wax might have done the trick, but it is brittle when set.

That reminds me of a repair once carried out to a Moto-Reve magneto (Gianoli) high tension brush which permitted the spark to leak through a minute cap. A sleeve, formed from a fountain pen cap, was pressed on to the brush holder and proved a great success.

## An Easily Made Blowlamp.

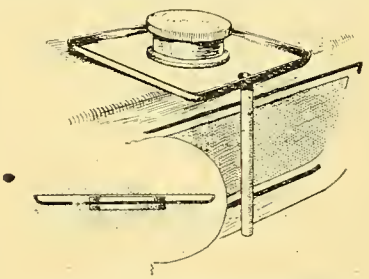
FOR many little repair jobs intense heat is often wanted. A self-blowing spirit lamp can be bought for about eighteenpence, and a petrol blowlamp may cost at least three half-crowns, but Mr. R. J. Freeman, of Coventry, sends his idea for an acetylene blowpipe made from oddments. The items in it are a pipe of $\frac{3}{8}$in. to which is screwed an elbow piece; in this elbow is screwed an old acetylene burner which has had the steatite removed and placed with a piece of iron drilled with a $\frac{1}{16}$in. hole. Opposite the burner is inserted a cycle valve plug with the blind end broken off. This is connected by rubber tube to a football adapter (a simple non-return valve obtainable at any cycle shop), this again being joined by rubber tube to a cigarette holder or pipe mouthpiece. A length of pipe connects the $\frac{3}{8}$in. pipe with an acetylene generator. Blowing down the mouthpiece, after the gas has been lit, produces the characteristic blue flame of the blowpipe, and the football adapter valve prevents gas reaching the operator's mouth.



This simply constructed blow pipe was made for a few pence.

## Protecting the Tank.

HERE is a device in the making of which the last-mentioned gadget will prove useful. It is suggested by a reader who does not embellish his notepaper with either name or address; this is needless modesty, for the gadget is quite good. It will be seen from the sketch that the device is to catch splashings of petrol from the region of the filler cap and convey them away; it consists of a 5in. square of tin with turned-up edges, which is fitted over the filler cap bush in the tank, and a rubber or leather washer fits snugly round the orifice. A piece of pipe runs away from the tray to below the level of the tank, and two blobs of solder under the opposite corners serve to tilt the tray outwardly a little. No doubt the device could be almost completely concealed by means of knee-grips.



A device for protecting the enamel of the tank from waste petrol.

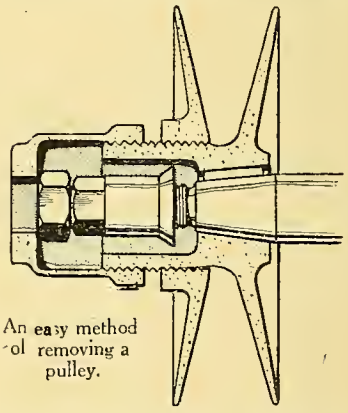
## Auxiliary Petrol Supply.

WHILE on the subject of tanks, here is another scheme, the authorship of which is wropt in mystery—except that it has apparently been evolved by a gentleman of the name of Mr. Mathew. Mr. Mathew has evidently been stalled for want of petrol on some occasion, and suggests a triangular tank inside the main petrol reservoir; this triangular affair to be pivoted in a state of unstable equilibrium. The filler cap with its gauze filter discharges into the auxiliary tank, which, when full, overflows into the main tank; thus the auxiliary supply is always replenished first. When the main tank runs dry, the filler cap filter is withdrawn, and, by pulling a knob, the auxiliary is tipped over, thus emptying its contents into the main tank and enabling the rider to carry on to the next garage.

Carrying a small auxiliary petrol supply inside the tank.

## Removing an Old Triumph Pulley.

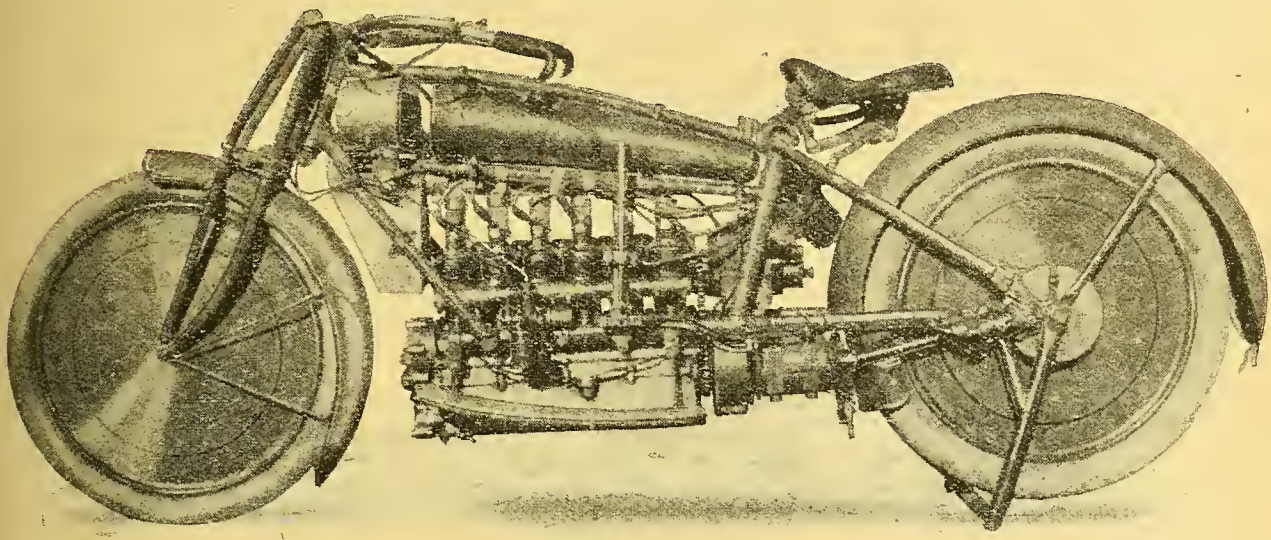
MR. L. BUCKLEY, of Stoke-on-Trent, rides a pre-war Triumph with engine-shaft pulley, and suggests this method of removing this unit when engine repairs become necessary. His scheme is to unscrew the adjusting flange nut cap, partly unscrew the mainshaft pulley nut, place a thick nut at the end of this, and screw on the cap nut again, jarring it with hammer and ring key until the pulley is drawn off the tapes of the shaft. This is quite useful, but Mr Buckley evidently does not know his Triumph. All one should do is to reverse the pulley nut, thus dispensing with the extra packing nut, etc.



An easy method of removing a pulley.

# A 6 CYLINDER MOTOR CYCLE.

## An Ambitious Machine Designed and Built by a Spanish Enthusiast.



Inlet valve side of the Spanish six cylinder motor cycle. Observe the neat layout of the transmission.

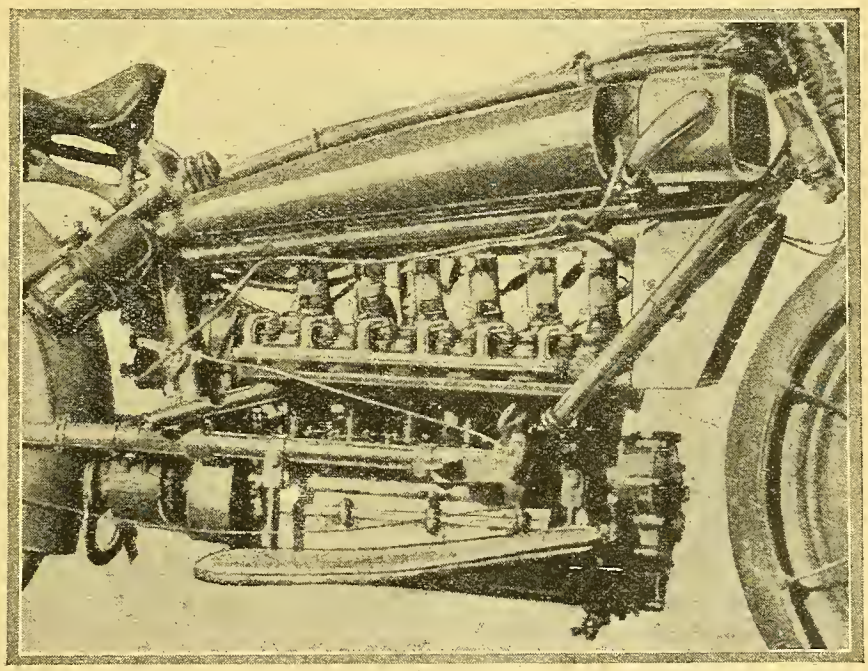
SIX-CYLINDER motor cycles are a rarity, although a few have been described in the columns of *The Motor Cycle*, the machine illustrated is interesting as being probably the most ambitious mount in the world of single trackers. The last six-cylinder motor cycle we described had a "twin-3" radial engine, which, besides being remarkably light—under 200lb., in fact—ran with a smoothness that could only be likened to an electric motor.

Designed and built by a Spanish enthusiast, the machine under review has six cylinders in line, is water cooled, has three speeds and reverse, and is shaft driven. The bore and stroke are 50 m.m. and 60 m.m. respectively, the total capacity being 708 c.c. As will be seen from the illustrations, the valves are on each side of the cylinders, the cylinder heads are therefore of T formation.

Though water cooled, this fact is not immediately apparent, as the radiator is neatly located in the fore end of the tank. The thermo syphon system is used.

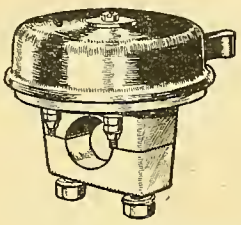
It will be observed that the engine, gear box and the various smaller units are neatly disposed, and that the machine has not the appearance of being unduly heavy or cumbersome.

The designer-builder-owner is in the fortunate position of being able to carry out his ideas of motor cycle design. He also owns and runs a Henderson, Harley, Clyno and a N.U.T. Hence his stud contains a six, a four and three twins of various sizes. Apparently our Spanish friend does not care for singles, but he certainly should have one in order that his stable be really complete



Exhaust valve side of the engine. The radiator does not detract from the general appearance of the machine.

# AMONG THE ACCESSORIES.



## Controlling Powerful Lamps.

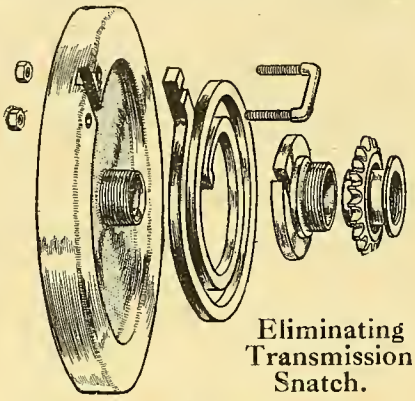
All systems of electric lighting may be controlled by the Dome handle-bar "dimmer," which will enable motor cyclists to return the courtesy hitherto more often possible to car owners only. The Dome Products Co., 292, Stratford Road, Manchester.)

## Protecting the Oil-can.

Mangled and crushed oil-cans have hitherto been the lot of the motor cyclist, who will welcome this new screw-supported type introduced by James Grose, Ltd., 4, Old Jewry, London, E.C.2. It is made usable by undoing one or both of the milled nuts.

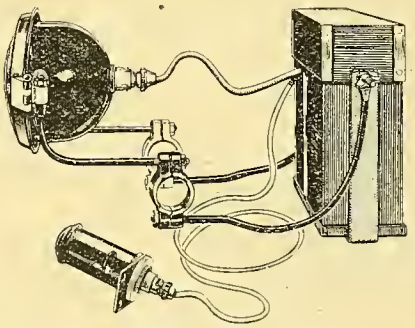
## For the Passenger's Comfort.

Made of beaver mohair and heavy wool tartan cloth, this useful sidecar rug is sold by Ramont, Ltd., Finsbury Pavement House, London, E.C.2.



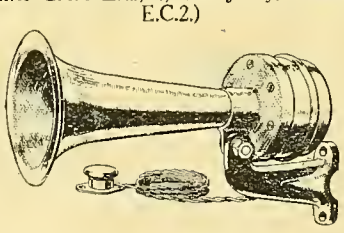
## Eliminating Transmission Snatch.

Designed for outside flywheel types of engine, the Gold shock absorber makes use of one very powerful "clock" spring. It is simple and apparently amply strong. (Harry Gold, 149, Elderslie Street, Glasgow).



## Inexpensive Electric Lighting.

Supplied at £3 3s., complete with tail lamp, this is quite a practical lighting set, complete with bracket, head lamp and battery carrier. (James Grose Ltd., 4, Old Jewry, London, E.C.2.)

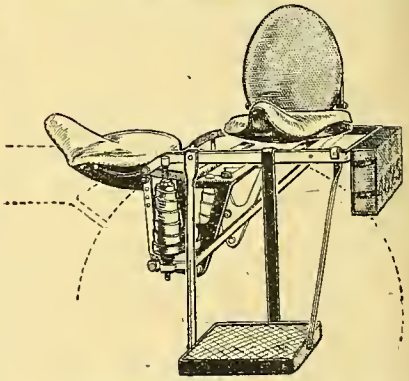


## A Powerful Electric Horn.

More suitable on account of its price (£3 10s.) and massive construction for the sidecar than the solo machine, the "Clear-Hooter" electric horn combines an exceedingly loud note with a current consumption of 18 watts. (Clear-Hooters, Ltd., Highgate Square, Birmingham.)

## Child's Folding Sidecar Seat.

Fitting into plates screwed on to the sidecar floor, this simple auxiliary seat is easily detached and folds up into a very small space. (Vivian Hardie and Lane, Ltd., 24, Woodstock Street, London, W.1.)



## Combined Pillion Seat and Saddle.

Saddle, luggage carrier, pillion-seat with a foot-rest, tool-box and tail-lamp are all suspended on one pair of volute springs on the X.L.-All "Combination" device, which is supported on the carrier proper of the machine. (John Leckie & Co., London Saddlery Works, Walsall.)

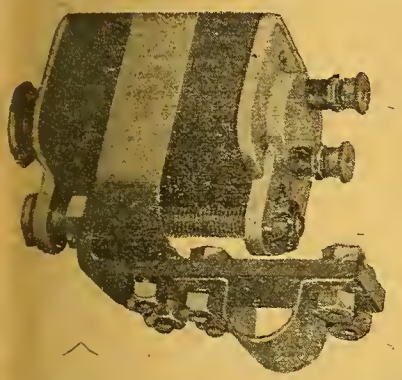
New and neat F.R.S. horn, which, possessing the well-known F.R.S. one-nut clip and no visible "twists," is distinguished by an appearance of neat solidity. It is finished in black, and in action it gives a pleasing sonorous note. F.R.S. Lamps, Vere Street, Birmingham, are the makers.

# A PERMANENT MAGNET LIGHTING DYNAMO.

## The E.H.C. Generator; Magneto Type Armature; Positive Cut-in Switch; and Automatic Tension Adjustment for Driving Belt.

ALTHOUGH the use of permanent magnetic fields and an H section armature may not offer the highest electrical efficiency, such a layout lends itself to an exceedingly simple and compact form of lighting generator quite suitable for motor cycle work.

There are many people who raise objections to this type of machine, however, on the score of the difficulty of obtaining sparkless commutation and the possibility of having back flows of current from the battery as the armature passes through its two zero positions in each revolution. To



Universal adjustable bracket and belt tensioning spring. The E.H.C. dynamo itself weighs only 5 lbs. and is 5in. long by about 3in. square.

avoid these troubles the usual procedure is to use a four-section commutator, two of the segments being dead, and of such dimensions that they pass under the brushes at the moment when the potential between generator and battery is approximately in balance.

This method of construction is employed in the neat square-shaped E.H.C. dynamo made by E. Hallowell and Co., of Lower Hanover Street, Leeds. The laminated armature is of magneto type, H section, and running on ball bearings carried in aluminium end plates, which are bolted to a tunnel made up of the iron pole shoes and their aluminium cover plates. End plates and tunnel thus form a waterproof assembly in which the armature revolves. Secured to the pole pieces by screws are the four U shaped tungsten steel magnets. One end of the armature is extended as a spindle for the driving pulley; the other end carries the disc commutator, on to which bear the two collecting brushes in the end plate.

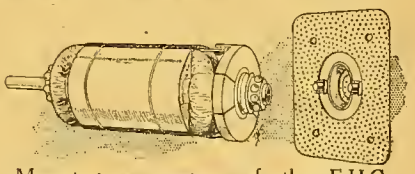
### Cut-out Without Wearing Parts.

One end of the armature winding is connected to one of the "live" sections of the commutator; the diametrically opposite section remains "dead" when the machine is at rest, but has a small projecting lug to which connection from the other end of the winding is made when a reasonable speed is attained. This connection is made centrifugally by means of a flat spring, weighted at the end, and projecting from the free end of the armature winding. When the armature ceases to revolve the spring breaks contact with the commutator lug, thus preventing a discharge of the battery through the dynamo winding.

An outpnt of about 3 amps. is given, and the dynamo may be used with either 4 volt or 6 volt accumulators, the latter being recommended; adequate lighting for a sidecar outfit is obtained.

### Driving Arrangements.

To suit motor cyclists who already have accumulator sets fitted on their machines is the special function of the E.H.C. dynamo, and with this end in view it is mounted on a special bracket capable of a wide range of adjustment. Mounted on a steel plate clipped to a frame tube is a long transverse screw, and the dynamo swings on this upon trunnion bearings carried in cast extensions of the end



Magneto-type armature of the E.H.C. dynamo, showing simple centrifugal cut-out, commutator and collector brushes in end-plate.

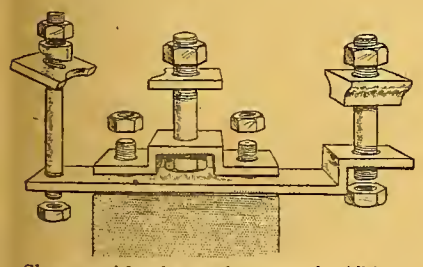
plates. The movement of the dynamo is limited by a large leaf spring bearing against the carcase of the machine and resisting the pull of the belt, thus the pressure of the spring takes up any slack in the transmission.

Lateral adjustment of the dynamo belt line is effected by means of the long screw above mentioned. The drive, preferably taken from the engine-shaft or clutch casing, is arranged for ¼in. round belt, and the armature must run at approximately three times engine speed. Complete with bracket and pulley, the E.H.C. dynamo sells at £5 15s., which is quite a moderate figure.

# COUNTERSHAFT GEAR ON AN OLD MACHINE.

## Bringing an Old Machine Up to Date.

ONE of our readers in Ireland, Mr. L. Hilton, of Dublin, inspired by a recent query regarding the fitting of a countershaft gear to an old clutch



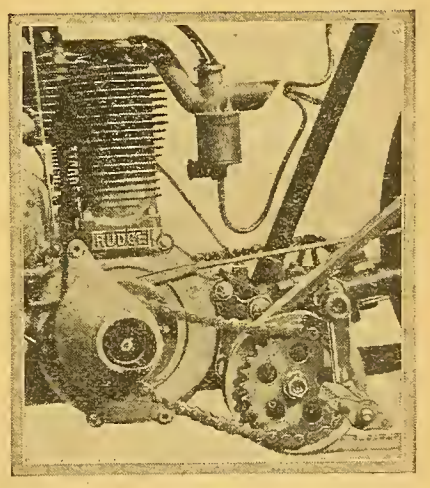
Sheet metal bracket used to carry the Albion gear box beneath the Rudge bottom bracket.

model 3½ h.p. Rudge, forwarded the accompanying photograph and details of a conversion which he carried out on his own machine, using an Albion lightweight two-speed box, which has functioned with complete success.

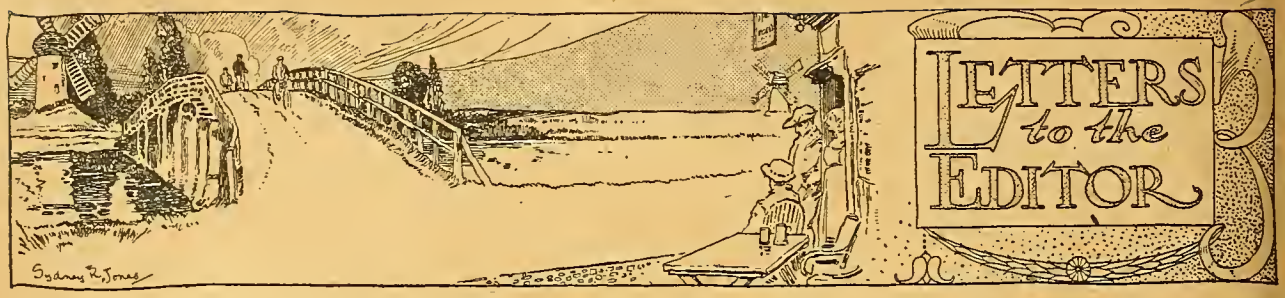
Carried beneath the pedalling bracket, the gear box is suspended from a sheet steel hanger ($\frac{3}{16}$in. material) clamped to the stays and engine lug by one $\frac{3}{8}$in, and two ¼in. bolts. Further explanation is almost unnecessary, for the sketch shows the shape and disposition of the various parts. The slope of the forward bridge piece is provided for by a shaped washer, and both it and the middle bridge need clearance for the saddle tube.

Thicker material is needed for the rearmost bridge, which is shaped to clamp the rear stays where they leave the bottom bracket. A wider pedal starting gear spindle is needed, of course, and the engine-shaft sprocket is screwed on beside the existing pulley, the clutch, of course, being still available.

Although the gear is only a lightweight model, our reader is perfectly satisfied with the results he has obtained.



An old clutch model Rudge fitted with a lightweight Albion two-speed gear by one of our readers.



The Editor does not hold himself responsible for the opinions of his correspondents.

**Correspondence should be addressed to the Editor, "The Motor Cycle," Dorset House, Tudor Street, E.C.4, and must be accompanied by the writer's name and address**

### *UTTERLY AMAZING SPEEDS.*

Sir,—I am constantly coming in contact with the 60 m.p.h. hero. He is always referred to "Motor Cycles and How to Manage Them." Under the section labelled "Useful Data" is a table of engine revolutions at different speeds per hour with different gear ratios. If the tale of the hero is true, and if the table is accurate, there are quite a lot of standard engines in existence that willingly turn over at speeds in excess of 7,000 r.p.m. While if clutch, belt and wheel slip are taken into account, the rate is even higher. As Mr. Euclid once said, "Which is absurd."

DONALD S. PARSONS.

### *AN "AGONY PAR."*

Sir,—May I appeal, through your columns, to some bright spark for a suitable method of carrying rubber solution in the tool bag without keeping it in a hermetically sealed cast-iron receptacle or wrapping it in vast quantities of cotton-wool? B.T. 6807.

Cambridge.

### *REAR-LAMPS FOR ALL.*

Sir,—I notice that your correspondent "W.K." thinks that he should be let off scot free if his rear light jolts out accidentally. Let him just reverse the positions and imagine that he has run into something like a timber waggon or a hay cart whose rear light has jolted out and see if his idea has altered. DOUGLAS.

London, S.W.18.

Sir,—I fear "W.K.'s" idea is not practicable. If a motor cyclist whose rear light had gone out were not to be fined, he would not care whether it were alight or not after once lighting it. A. O. RUSSELL.

### *AVERAGE SPEED INDICATORS.*

Sir,—I thoroughly agree with the opinion expressed by "Noall" as to the greater value of an average speed indicator than that of the usual speedometer in his article on the subject in the issue of *The Motor Cycle* for January 12th.

Comparing the two instruments in the case of a motor cycle, it must be remembered that one gets:

| *In Av. Speed Indicator.* | | *In Ordinary Speedometer.* |
|---|---|---|
| 1. Average speed | instead of | 1. Velocity. |
| 2. Mileage covered | | 2. Mileage covered. |

and 3. Clock (an essential feature).

*Three* items of information as opposed to *Two*.

In the case of a motor car a clock is more frequently part of the instrument equipment, so that its cost may with fairness, in such a comparison, be deducted from that of the average speed indicator. Bulk and weight being here of less importance, the cost of the clock could if desired be spent in adding a velocity indicator, which, I imagine, especially if worked on either the Jaeger or on the Bonniksen principle, could easily be included in the instrument.

But if it were a question of having either an average speed indicator or the present speedometer, I personally would plump for the former, as, I am sure, would many others were the several virtues of the two instruments placed fairly before them. CYRANO.

Davos-Platz.

### *MOTOR CYCLISTS IN DREAMS.*

Sir,—Does "Maude Stanfield" and "W.H.M.P." really want us to believe that, simply by concentrating and holding the image of our desire in mind with persistency, the thought will materialise? This is hardly a rational statement, and would suggest the thought *never* will materialise, but that, consciously or unconsciously, the thought energises other factors which may possibly contribute to ultimate success. As regards bringing the Scriptures to support such a "misfire," please let us apportion sacred things to their correct sphere. V.N.

London.

Sir,—In spite of Miss Maude Stanfield's and "W.H.M.P.'s" assertions to "motor cyclist in dreams," I fear the only way he will get a motor cycle is to buy it, as Aladdin and Co. have been seen off the stage for quite a long time. A.O.R.

Warrington.

### *LUMINOUS SPEEDOMETER DIALS.*

Sir,—It is possible to apply luminous paint to speedometer hands with most beneficial results. If the dial is white, it can be blacked over with Indian ink applied with a small brush; if already black, so much the better. Most watchmakers will be able to apply two coats of luminous paint for about 3s. 6d. My Bonniksen has been so treated and still shows up well after twelve months' use.

N. A. C. JONES.

Sir,—May I inform "Triardo" that luminous speedometers are of little use owing to their light being buried by the reflection of the road in the rider's eyes.

A. O. RUSSELL.

### *SIDECAR FUEL CONSUMPTION RECORDS.*

Sir,—Though my machine, an X.Y.Z., purchased from ex-W.D. stores after the Franco-Prussian war, is rather heavy on petrol, its average consumption being between 303 and 317 m.p.g, still I can claim what I consider quite a fair maximum speed, having, on the 29th of February last year, covered a measured mile in Grafton Street, Dublin, in 47.39393 seconds under the official observation of the combined forces of the I.R.A., D.M.P., R.I.C., B. and T.'s, Girl Guides, and Madame Marcievioj's Boy Scouts.

I would recommend to "Tophole's" notice the tip that, by adding one desert-spoonful of sodium chloride to the gallon, he will improve his consumption by at least 497%.

Dublin. QUITE SATISFIED.

Sir,—The claims made by "Tophole", regarding speed and petrol consumption are, in my estimation, quite feasible. Having read the ridicule he has received, I think it is high time to let you hear of the performances of my 1911 3½ h.p. Triumph with three-speed hub and C.B. sidecar. My friend and I make a weekly trip from Bolton to Ambleside, distance seventy-four miles, weight of passengers twenty-three stone. Under favourable conditions, we complete this run in one hour fifty minutes. Petrol consumption for both ways works out at $1\frac{1}{10}$ gallons, using no gadgets whatsoever. I must congratulate "Tophole" on his ability to tune a modern engine, as I always held the view that pre-war machines are better and more economical than modern makes. NORMAC.

Bolton.

### MYSTERIOUS TEMPORARY SEIZURES.

Sir,—Some time ago "Ixion" commented upon the fact that, though a chain may be in correct adjustment when at rest, under load it stretches enormously and lashes about in an alarming way. It can be easily observed that the slack side does not run smoothly in a single curve, but in a series of waves which advance or recede with changes of load or speed. It is reasonable to suppose that the jar of the machine on the road or a sudden change of load, such as occurs when the engine misfires, might fling those waves in the chain upon the sprocket in such a manner that the rollers would be caught up a pitch ahead and that the angle of the tooth face would prevent the chain slipping back to its proper place.

The chain in this position would in all probability lock the shafts and produce the symptoms which have been often described under the heading of "Mysterious Engine Seizures."

Declutching to kick-start would allow the tension in the chain to turn the engine or gearshaft backwards and so replace the chain.

I have had, with my P. and M., exactly the same experience as Mr. Penny under circumstances which ruled out a premature explosion being the cause. I therefore cannot blame the plug, but rather would congratulate the chain makers upon having evolved a chain which stood up to the enormous load which such a locking action would put upon it.

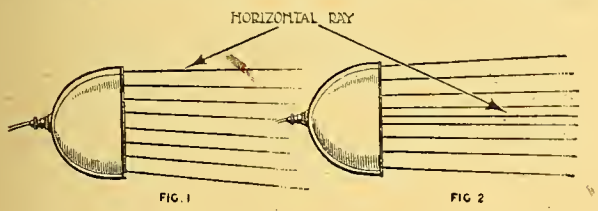
T. HALLIDAY TURNER.

### HEAD LAMP DIMMING.

Sir,—In reply to "Rover's" criticisms of my previous letter on anti-dazzle head lamps, I shall endeavour to answer his four criticisms with the aid of three more sketches.

(1a.) With a head lamp fitted with the American lens which I previously described, the beam of light emerges as in fig. 1, the top of the beam being horizontal. In an ordinary head-lamp the beam emerges as in fig. 2, the light shining into the eyes of persons approaching. (1b.) I quite agree with "Rover" that the beam is divergent in a horizontal plane and weakened in intensity inversely as the square of the distance from the lamp, but is not this so with every head lamp? If the beam was not divergent, the sides of the road would be in darkness.

(2.) The function of the lens is not to deflect the light rays on to the ground alone, but also ahead of the car, at the same



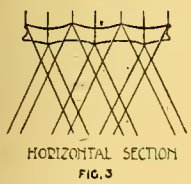


Diagram referred to in Mr. E. W. Troughton's letter on head lamp dimming.

time keeping the powerful rays below the eye level of approaching cyclists, etc., as in fig. 1.

(3.) I admit I was wrong in saying "without loss of light." What I intended to say was "with minimum loss of light." The lens does not obscure or diffuse the light rays, but directs them. As for "wide depression," I never mentioned it. What I said was "wide *dispersion* and no glare."

(4.) The candle-power necessary with this lens is the ordinary candle-power used in head lamps. In an ordinary head lamp the candle-power is not enormous. Why need it be with this lens? Does "Rover" know that there is a maximum legal candle-power of head lamps in many States of the U.S.A.? I do not understand him saying "In ordinary lamp, when rays are parallel, the projected filament will be 13ft. high and 1ft. wide at 100ft. from lamp." An ordinary head lamp does not send out parallel rays, but rays diverging equally in all directions, as in fig. 2. "Rover" keeps mentioning parallel rays outside the lamp. Is he thinking of searchlights? Surely "Rover" does not expect the light to be as powerful 100 ft. from the lamp as 1ft. away?

Fig. 3 shows a horizontal cross section of a portion of the lens, showing how the light is spread to illuminate the full width of the road. I think that it is generally understood that the danger of powerful head lights is caused by the powerful light rays shining into the eyes of persons approaching, and temporarily dazzling them, causing them to lose their sense of direction. This lens, which I previously described in your issue of December 29th, achieves its results by keeping the powerful light rays *always below eye level.*

Finally, this lens is designed, manufactured, and sold by the largest producers of high-grade lenses and optical instruments in the world, and they know their job. Usual disclaimer.

E. W. TROUGHTON.

### OBSTINATE VALVE CAPS.

Sir,—Referring to "Zenith-Jap's" letter, I would like him to try just a small quantity of (ordinary common garden) turpentine poured round the head of the valve caps and warmed by a small blow-lamp.

SIGNET.

London, S.E.3.

Sir,—May I offer a little advice to both "Zenith-Jap" and Mr. Brewis, afflicted in various ways with their valve caps. I had a similar trouble to the first-named with my Enfield, on which I twice had to have the caps drilled out to remove them.

On the last occasion, my man made the joints with a preparation called "Metalastene," which he also smeared over the threads. The caps have now been in use for some three months, and, on removing them last week, I found no difficulty whatever.

A. PORTEOUS.

### TOP GEAR STUNTING.

Sir,—I have been amusing myself lately with my machine by just seeing what it would do and how it would behave if I only used the top gear. After the kick-start, it makes one feel rather an ass to double away with the machine, but it certainly is more exciting when it comes to hill-climbing. It brought back the days when I rode a single-gear 1911 Triumph, and jolly well it went too.

Would it not be a good thing for the A.C.U. to organise a trial for modern machines minus the gear box, the manufacturers having the choice of the single-gear to be used? It would be extremely interesting to see how some of the modern highly efficient machines would get on without second and third gear to fall back on, and it would surely tend to make manufacturers search for still greater efficiency.

TRIARDO.

Nottingham.

### DIAGNOSING EXCESSIVE TYRE WEAR.

Sir,—I had much trouble with my last two front tyres, but found, after wearing two covers away in about 3,000 miles, that my wheel was oval (slightly, of course)—and consequently caused the wear.

E.H.

Longton, Staffs.

Sir,—On taking the rear wheel out of my G.P. Morgan, I find that one half of the circumference of the tyre is worn nearly smooth, while the other half is hardly worn at all. I can understand one side of the tyre wearing through the wheel leaning or a patch wearing here and there through fierce braking, but I do not see how I can put the brake on the same half of the wheel every time. I have examined the brake linings and drums and find them all right, and, unless it is caused through the axle being slightly bent, I confess I must put it down to faulty construction of tyre. Perhaps some of your readers may have had a similar experience.

J.A.S.

New Mills.

### WEIGHTS OF SIDECARS.

Sir,—I wonder if anyone else had the same difficulty I had of finding the weight of a touring sidecar. I had "umpteen" lists from the Show, and only one of them quoted the weight of the sidecar, the one exception being a Canoelet "Featherweight" at 80 lb.

F.C. 3888.

Oxford.

## PRESSURES OF MECHANICAL PUMPS.

Sir,—"Dudley" writes in a recent issue, referring to the Showell pump, that he "cannot understand how pressure can be produced by an arrangement of this description, and, for lubrication to be reliable, pressure is essential."

Fig. 1 shows two spindles which were tested in a brass barrel at 1,250 r.p.m. Each spindle had a diameter of 1¼in. and a screwed length of about 7in. The first, with a single semi-circular groove or thread of fine pitch, developed a pressure of 300 lb. on the square inch with a small volume of delivery—unfortunately, not measured, but probably of the order of a gallon an hour.

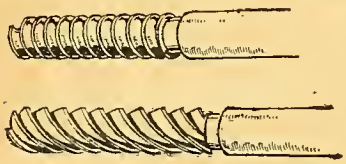

Fig. 1.

The second spindle, with seven grooves of triangular section and with a coarse pitch or lead (thread angle approximating to 40°) delivered thirty gallons per hour, adequate for a 30 h.p. car engine at a pressure of 10 lb. to 12 lb. per square inch, the oil in both cases being a thick standard engine oil. There is therefore no question but that the pump, as a type, is capable of delivering the very highest pressures, but your correspondent is in error in his broad statement, "For lubrication to be reliable pressure is essential." Probably he really means that for the delivery of oil to the place where lubrication is wanted pressure is essential to get it there. It is a fact that with properly designed journal or thrust bearings it is *only* necessary to deliver oil freely at the right spot when the running surfaces will do the rest and ensure conditions of absolutely perfect lubrication.

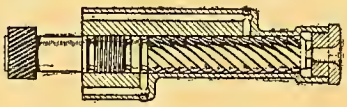

Fig. 2.

The objection to needle valve control fails when it is realised that with appropriate design and finish the working pressure may be high without raising the slip pressure to an excessive figure, for with entirely closed delivery the whole work of the screw pump is spent on "slip." The screw pump can, however, quite easily be made to supply half-a-dozen different feeds at different pressures at one and the same time, or the whole delivery can be taken off at any selected pressure, and in the facility for so doing this pump is, I think, unique.

The accompanying drawing, fig. 2 (patent 152,767, 1919), shows that all one has to do is to tap off the delivery at different points to get different pressures, and it indicates that the facility referred to arises from the fact that the pressure is raised gradually—with perfect regularity—all the way from suction end to delivery end. In the drawing, the reversed fine pitch thread on the spindle at the left of the barrel is for oil retention—a cheap and highly efficient gland substitute.

The screw pump was made in quantities for stock as an oil "elevator" forty years ago; it was used at one time on the Douglas motor cycle engine, but improvements by which volume, pressure, and practical efficiency are combined are of quite recent date.

W. L. SPENCE.

## COMPRESSION RATIOS OF RACING MACHINES.

Sir,—I read with much interest "Harmony's" brief description of his 1922 T.T. Sunbeam.

Of course, the beautiful workmanship and finish of these machines are known to all motor cyclists, and now that the T.T. engine is being sold to the public, no doubt its performance on the road in the hands of true amateurs will cause a great amount of interest. My chief object in writing this letter is to express surprise at "Harmony's" statement that his compression ratio is 5.9 to 1. Bearing in mind that the winning A.J.S. in last year's T.T., ridden by Howard Davies, had a compression ratio of 5.5 to 1, the Sunbeam ratio seems frightfully high for a production machine.

A discussion on this topic would no doubt interest a large number of readers.

E. F. G.

London, S.E.18.

## ASSEMBLED MACHINES.

Sir,—It is interesting to note that since his original article appeared "Ixion" has somewhat modified his views, but he still appears to have the impression that an assembled machine is always sold at a lower price than a "one factory" job, or, as he prefers to call it, a "special design." This is certainly incorrect, and we need only mention the following three machines, which, in their particular class, are cheaper than any assembled proposition with a comparative specification:

(1.) 2¼ h.p. Radco (single gear, two-stroke), £35 14s.

(2.) 2¾ h.p. Raleigh (350 c.c., four-stroke, two-speed, clutch, and kick-starter), £68.

(3.) 4¼ h.p. Quadrant (three-speed, coach-built sidecar), £105.

"Ixion" appears to lose sight of the fact that a really good engine and gear box are not all that is required. Every component part of the machine should be designed in harmony with other parts, and we would mention the Velocette lightweight as an ideal illustration of what we mean. The Radco frame fitted with a Velocette gear box and a Levis engine would be an atrocity, yet each of these three component parts taken separately is excellent.

On the point of standardisation and quick replacement of parts, the owner of an "assembled" machine is not in the happy position suggested by "Ixion."

As agents handling motor cycles in really large numbers, on many occasions when we have requested the makers of "assembled" machines to replace defective parts free of charge, we have been referred to the clause in their guarantee stating that they "are not responsible for the specialities embodied in their machines, the products of other manufacturers," and requesting us to take up the question of replacing with the manufacturer of the component part. On the other hand, the manufacturer of a "special design" machine is usually eager to satisfy both his agents and the riders, and does not quibble at replacing any defective part. Our experience has been that we can always obtain immediate delivery of spare parts for "special design" machines, and that these parts are a correct fit. We have not had this happy experience when requiring spare parts for "assembled" machines which have passed through our hands.

Another point which helps towards the undoubted superiority of the "special design" is that every feature embodied in such a machine is tested out on the road for months—in some cases to our knowledge, even years—before being embodied in a new model.

In conclusion, we need only point out the comparatively small depreciation on a "special design" machine at the end of twelve months' use compared with an "assembled" machine.

We have great admiration for "Ixion," and think that perhaps he would alter his views if he had any lengthy experience of "assembled" machines. We believe he always rides machines of the "special design" breed.

THE PREMIER MOTOR CO.,
G. R. MORGAN, Sales Manager.

Sir,—While I do not especially favour the assembled machine, I favour the assembler for one reason. He will do his utmost to fit his machines to suit the public demand, whereas the manufacturer will not.

I will quote two instances of the latter—Triumph fork springs and Rudge-Multi belt drive on sidecar machines.

Glasgow. A.O.F.

## THE GREAT GAME.

Sir,—As one who has always had a hankering for this kind of amusement, I should just like to remind "A.McL." that the only thing that prevents me participating in it *is* the fear of badly kinked rims and missing mudguards, etc.

Now, if the manufacturers were to come along and say, "We would like you, if you can arrange it, to ride in such and such a trial, and we will bear *all* the cost and any damage you or your 'bus might sustain," a very different tale might be told. I know of amateurs who ride in these trials on the most expensive machines, but do you see them on the road in the ordinary way? Well! sometimes—and often enough behind a big wheel of a posh car. A broken frame to these fellows is nothing; but, to some of us—well, what does anyone else say about it.

Cheshire. BROUGH SOLO.

(19–20)

### T.T. OR LONDON-EDINBURGH.

Sir,—"W 5420" has overlooked the fact that my letter was in answer to a suggestion that the T.T. date should be altered because it clashed with the London-Edinburgh. Also, "W 5420" will find that he has misread my letter. I did not suggest the postponement of the London-Edinburgh, but that it should be abandoned, because it does nothing to improve, or demonstrate the degree of perfection attained by the modern motor cycle. This event served a purpose ten years ago, but to-day it proves nothing. If it were possible to have a London-Edinburgh trial without the huge block of trade, semi-trade, and "shamateur" entries, I would agree that it might be quite an interesting holiday trip. Surely the Yorkshire clubs are organising something for Whitsun suitable for "W 5420." As regards inconvenience to others, "W 5420" must remember that the other easy competitions are organised by small clubs with limited memberships, and the stiff events organised by other large clubs attract only a comparatively small number of entries. A. V. SMITH.

### INACCESSIBLE ENGINE NUMBERS.

Sir,—Engine numbers have now to be declared in the licence registration book. Is there any sane reason why makers of engines should, in the case of two-strokes, stick this number on the flywheel side of the crank case? I have just had the pleasure of removing my engine flywheel to get at this information, and my engine is one of quite a well-known make.

Sheffield. COMMON SENSE.

### THE WORLD'S BEST ROADS.

Sir,—Mr. H. Beacon says he spent every minute possible in the saddle for four months, and never saw a bad road, and never hit or saw a single pot-hole. I wonder if he thought to turn his petrol on, for if he had, and came South as he says he did, he would have reached Essex.

C. W. BEALE.

Sir,—Your correspondent Mr. H. Beacon states he has never met a bad road in his travels in the South. Has he never traversed the road from Staines to Egham, or at Barnet, or near Hungerford in Wilts? However I agree that English roads on the whole are very fair.

Wimbledon, S.W.19. POTHOLE.

### WHY THE REAR PLUG SOOTS UP.

Sir,—I have, whilst laid up, been thinking over the causes of the rear cylinders of the majority of the twins sooting up the plug. (Mine does.) I fancy I have found the cause, and offer it here for what it is worth.

If you will allow me to take the new sporting Duzmo, as illustrated on page 375, as my example, you will notice that the front exhaust pipe is, from measurements of the print, exactly $3\frac{7}{8}$in., and the rear one is $1\frac{3}{4}$in.—that is, to all intents and purposes, twice as long. This means, in the first place, that the friction is twice as much; and the inertia of the gases in the tube twice also. I contend that this produces a greater suction or vacuum in the rear cylinder, and so draws the oil up. This is further helped by the direction of the splash.

This could all be easily tested by the placing of a small pressure gauge in each of the exhaust pipes as near the unions to the cylinders as possible, and also a gauge in each cylinder head. This is necessary so that allowances may be made for the difference of compressions. Again, this difference in the compressions would not give the explosive values of the two cylinders; for I contend that the rear cylinder gets a richer mixture than the front one, owing to the front one not clearing all the residual gases from the previous explosion due to the extra length, and therefore resistance plus inertia.

The only suggestions that I can give for overcoming this is that the resistance of the longer tube should not exceed that of the shorter. This can be easily worked out. The other way is to have the two inlet ports on the outsides and the exhaust ports on the insides; and I fancy that this would give the best results.

I have no connection with any motor firm, and only used the illustration given because it was in front of me.

FAVILLE C. POULTON.

### T.T. RACES FOR PRIVATE OWNERS.

Sir,—Undoubtedly the A.C.U. is the organisation that should take this matter up and "do something" for the "majority," *i.e.*, the private motor cyclists who furnish this body with their income, but who have little to say in these matters. The "pukka" T.T. races are admittedly the most sporting events of the year, but would not the average sporting motor cyclist take more interest in a race of their own than watching the results of a few "chosen" riders who have the financial support of the manufacturers? Suggested obstacles are continually being put in the way of a private T.T., but I maintain that the old proverb "Where there's a will there's a way" is as true to-day as ever.

I therefore challenge the A.C.U. to do something for the private man. Will the secretary of this body say whether his organisation will do anything? An answer of "Yes" or "No" is required, as excuses will not help.

Should the answer be "No," perhaps some of your enthusiastic readers will communicate with me, and we will attempt to promote such a race *this year*.

Also, I am sure we can rely on the hearty support of you and your excellent journal. THOS. L. M. GIBSON.

Sir,—The correspondence under the above heading is of great interest to speed merchants of West Kent, but the objection appears to be the time it would be necessary to devote to practice, and qualifying laps, over the actual course, with its attendant expense. Nevertheless, should the T.T. idea materialise, we are prepared to pawn our best lamp sets in order to take part.

A more convenient method of giving expression to the private owner's speed proclivities would be *via* the medium of speed records for private owners. At present, speed records are solely the sport of the professional rider complete with factory backing, and I venture to suggest that, not only would wild and woolly speeds cease to be claimed for machines owned by private riders, but the results would prove a better guide to the prospective purchaser of a speed 'bus than obtains under the present arrangement.

Bromley, Kent. "BEAM."

---

### SUMMARY OF CORRESPONDENCE.

Redrute's" letter on the general lack of appreciation accorded to inventive genius and the difficulty of placing an invention on the market has attracted several replies. The Service Co., Ltd. (London), 289-293, High Holborn, London, W.C., write that they are always willing to consider any practical suggestion put to them by inventors. "Vento" (Bury) recommends The Inventors' Sales Agency, 22-24, Spencer Avenue, Coventry.

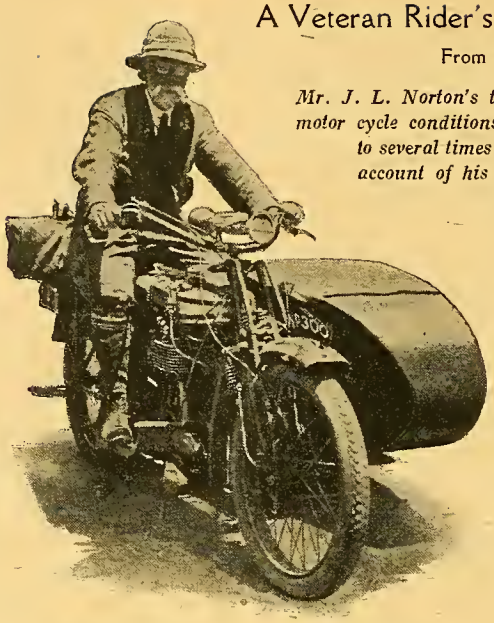
## A Veteran Rider's Experiences in South Africa.

From A Cape Correspondent.

*Mr. J. L. Norton's trip to South Africa, in order to study motor cycle conditions in that vast country, has been referred to several times in "The Motor Cycle"; the following account of his 3,000-mile tour cannot fail to interest.*



Mr. J. L. Norton, after finishing his 3,039 miles of rough riding in South Africa.

MR. NORTON, who is fifty-four years of age, was looking bronzed and well at the conclusion of his big tour, and in the course of an interview recounted his eventful story with a modesty and unassumption which is characteristic.

Landing in Durban in October, 1921, Mr. Norton journeyed on one of his own sidecar outfits from Durban to Maritzburg, and from there to Ladysmith and Newcastle. On this track he struck some of the worst roads in Natal.

### Through a Flooded Area.

On the Dundee road the bridges were washed away by the heavy floods, and the road itself was submerged at many points. The rider, as a result of this thoroughfare's condition, took the alternative road. Between Maritzburg and Johannesburg he went through no less than thirty-five rivers.

Arriving at Johannesburg he stayed for a week, and then travelled to Pretoria, returning later to Johannesburg. Kimberley was his next destination, but in this part of the journey he forced his machine through fifty miles of mud; water-logged land lay on every side, and the so-called roads were so deeply submerged that he had to ride through the bush itself, repeatedly lifting his machine out of the deep holes which studded his path.

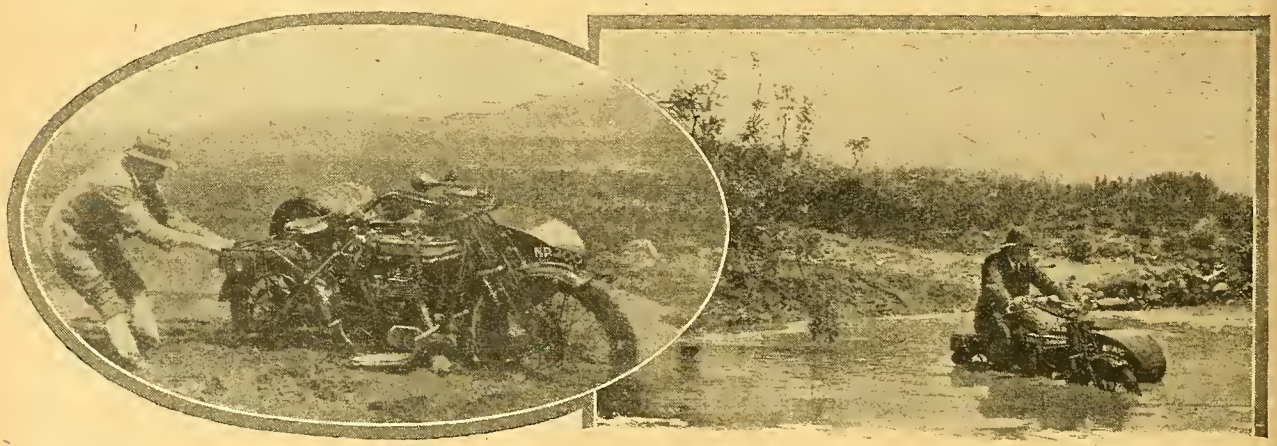
On the road between Kimberley and Bloemfontein the machine sank into the mud up to the axles a number of times, and thereabouts were to be seen many deserted waggons and motor cars, but a bicycle chain round his driving wheel helped the sidecarist considerably.

Earlier in his journey, before reaching Johannesburg, Mr. Norton struck a rock, with the result that the sidecar parted from the cycle with a report like the crack of a gun. Still undaunted, he fixed up the connection, and for 130 miles he travelled along with one front attachment only.

During this adventurous ride he sighted some wonderful specimens of birds. At one place he saw a black and white bird making a great fuss, flying three or four feet from the ground. He pulled up, and then saw the source of the disturbance, which was a cobra. Mr. Norton feigned to approach it from different angles, but upon each advance the snake made ready to strike. In the end he killed it with stones. Picking the snake up to examine it, the tail of the cobra wound itself round his fingers, and he dropped it like a live coal, feeling considerably scared.

### Magnificent Scenery.

The following morning the tourist returned *via* Stormberg, which provided magnificent scenery, and found that he had done over sixty miles unnecessarily. He was heavily handicapped by not being



Some idea of the conditions encountered during the "tour" will be gathered from these scenes *en route*. On several occasions the machine was brought to a standstill in consequence of deep mud, and scores of deep watersplashes had to be negotiated.

Freedom Works, John Street, SHEFFIELD.

**Through Bush, Flood and Veldt—**

able to obtain proper maps or a compass. His principal guide marks were the waggon ruts.

Passing over the Katsburg Mountains he almost wept to find that he had only two photographic films left. From wonderful points of vantage he saw great banks of cloud which looked like mighty seas. Once he was 6,000ft. high, where his amazed gaze fell upon clouds which resembled the billows of a great frozen sea. Far below he could see through a kloof a smiling valley, with a beautiful cottage set like a gem in its centre.

Wonderful natural life was seen on all sides, and included birds of brilliant plumage, as well as reitbok, springbok, and cranes.

### No Mechanical Trouble.

Throughout these adventures no mechanical trouble was experienced. In the way of spare parts a spare axle for the back wheel only, a valve, a few spokes, and a contact breaker were carried, and only a couple of the spokes were used. Just as he drew up at the garage at Maritzburg on the outward journey a puncture in the tube of the sidecar wheel occurred.

Travelling along the coast road Mr. Norton proceeded from Port Elizabeth to Graham's Town, and from there drove down to the Cape.

### Per Motor Cycle all the time.

During his sojourn in Africa he never rode in a train, and when he was interviewed two days before he embarked for England on January 6th he said he had no intention of so doing.

Mr. Norton feels sure that British manufacturers will yet obtain the South African motor trade, and if they will only make the ordinary provisions he prophesies that there is a big market for British motor cycles in the Union of South Africa.

# CLUB NEWS.

### Oxford M.C.

Particulars of this enterprising club, which has just announced a provisional programme of sporting and social events for 1922, may be obtained from the honorary secretary, Mr. H. Morton Bailey, 43, Cornmarket St., Oxford. The subscription of 25s. includes full affiliation with the A.C.U.

### Slough and District M.C. & L.C.C.

In spite of the inclement weather, the first annual general meeting held at headquarters (The Old Crown Hotel, Slough), on the 19th ult., was a great success. It was regretted that the president, Major E. R. Loder, was unable to be present. Mr. F. Robinson was in the chair, and the following officers were elected for the ensuing year: Captain, Mr. E. Finch; vice-captains, Messrs. A. Andrews, A. Gare, and W. J. Pond; hon. secretary, Capt. H. W. H. Dyke; hon. assistant secretary, Mr. F. J. Moore; hon. treasurer, Mr. T. H. Birch; hon. auditors, Messrs. E. B. Swayne and E. A. Tomlin.

### Bolton and District M.C.

The annual meeting was held on Monday evening of last week, when a large and representative gathering assembled. As a certain amount of apathy had been felt for some time among the members, it was decided that greater enthusiasm might be developed if the club were re-organised. Consequently, the whole thing was completely reconstructed and re-officered and many new members were admitted. Another general meeting was fixed later for Tuesday evening, February 7th, when the committee hoped to present a programme of summer runs and events for consideration. All motorists are cordially invited to attend this meeting. Communications may be addressed to the Rev. H. Headley, General Secretary, Raikes Hall, Bolton, or to the Trials Secretary, Mr. Crompton Guthrie, 50, Higher Bridge Street, Bolton. New members will receive a hearty welcome.

### Essex M.C.

As has been customary in the past, an early spring trial has been arranged, to take place this year, on Saturday, February 18th. Entries will be received by the honorary organiser, Mr. E. J. Bass, 40, Chancery Lane, London, W.C.2, up to the first post on Tuesday.

### South Shields and District M.C.

At the first annual meeting of the newly-formed Westoe Motor Cycle Club, which took place in the Regent Hotel, South Shields, on January 24th, the members decided to re-name the organisation as above. This step was made owing to the growth of the club during the past twelve months and the difficulty of locating it under its old title.

### Alnwick and District M.C.

Mr. J. W. Morrison presided over the first annual meeting, held at the Plough Hotel. Reference was made to the success which had attended the club's inauguration and first year's activities, whilst the financial position was considered very satisfactory, in view of the fact that there was a balance of £20 9s. 6½d. The meeting decided to hold a ball in aid of the Alnwick Infirmary, and to affiliate with the A.C.U.

### Sutton Coldfield and North Birmingham A.C.

Some hundred members and guests attended the ninth annual dinner at the Royal Hotel, Sutton Coldfield.

Mr. Gordon Owen presided, and after an excellent dinner Mr. Alec Ross proposed the toast of "The Club and President," mentioning, incidentally, an interesting piece of news, that Birmingham would this year give a T.T. Cup for the 250 c.c. class. We learned later that Mr. Ross had himself been responsible for collecting the money for this trophy.

In addition to the trophies, some 200 gold and silver medals were presented, and a very excellent concert completed a most enjoyable evening.

### North-West London M.C.C.

The annual dinner will take place at the Holborn Restaurant on Thursday next. The accommodation of the only room available is limited to 150, and members and friends desiring to attend should communicate at once with Mr. O. Hill, 5, Old Bond Street, London W.

### Northern M.C.

The club held its annual general meeting in the Crow's Nest Hotel, Barras Bridge, Newcastle-on-Tyne, on January 26th, the chair being taken by Mr. T. Dawson in the absence of Major W. Anderson, D.S.O., M.C.

A good report of the club's progress during 1921 was given by the secretary, Mr. O. L. Rutter, who said that the year had been in many ways a most difficult one for them, but had concluded in a very successful manner financially. They had an accumulated balance in hand of £40 7s. 8d., but there had been a lack of enthusiasm displayed by the members towards many of their competitions.

### Sheffield and Hallamshire M.C. & L.C.C.

There was a happy gathering of the members and friends at the Royal Victoria Hotel, Sheffield, when a party of over a hundred met on the 19th ult. for the annual dinner and prize distribution.

Mr. W. Hallam Pearson, the president, presided, and in front of him on the table was the massive silver cup, presented by *The Motor Cycle*, which was won by the club in the M.C.C. Team Trial for a second time last year. The Sheffielders are very desirous of again lifting the trophy in the coming season, for it then becomes their own property.

Prior to the distribution of the many prizes, Mr. W. Dovener, the hon. secretary of the Yorkshire Centre of the A.C.U. and of the Bradford Club, proposed the toast of "Our Club."

In responding Mr. S. Sawer remarked that 1921 was one of their most successful seasons, and they were hoping to make this year even more successful. He intimated that they were going to develop the social side as far as possible.

# CURRENT CHAT

## Time to Light Lamps

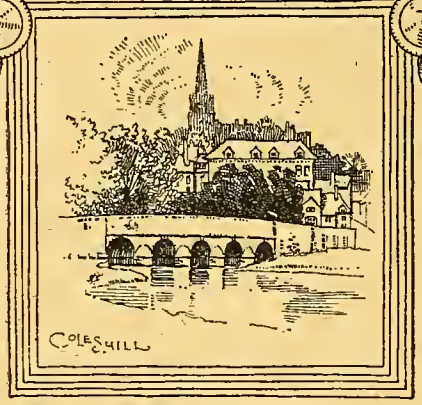
Number plates to be illuminated thirty minutes earlier, *vide* Road Vehicles Registration and Licensing Order (1921).



## Special Features

IMPRESSIONS OF THE SCOTTISH SHOW.

IN AND AROUND CONSTANTINOPLE.

A SIX-CYLINDER MOTOR CYCLE.

### "Where Is It?"

An extraordinarily large total of letters have now been received locating "Tourist's" main street hill, approximately 98% agreeing that the spot which our correspondent visited last summer was School Hill, Lewes.

### Motor Cycles in Denmark.

The number of motor cycles registered in Denmark shows a remarkable increase since 1910, in which year there were 3,428. In 1921 there were 14,241. The total number of motor vehicles in Denmark amounts to one vehicle per eighty-three inhabitants.

### For the Workshop.

Almost every motor cyclist who does his own repair work inclines sooner or later to the purchase of a lathe, which provides a wonderful extension to the limits of his hobby. Hitherto such a tool has made a serious hole in £25, but the model engineering trade is now going strong on a wonderful variety of useful 2-2½in. centre lathes at prices mostly under £5.

### Policeman and Motor Cyclist.

Among our usual weekly batch of letters alleging police persecution, it is refreshing to find an occasional correspondent taking the side of that much-maligned body. Writing "as a motor cyclist and also a policeman," and emphasising the recently published appreciation of London-Exeter competitors, "X.Y.Z." considers that "'persecuted' riders should make sure that they and their machines comply with the Law, see that they have lamps which illuminate their number-plates, and that they do not drive through towns and villages, especially at night, with exhausts making a noise like a machine gun." We agree.

### Engine Lubrication.

An ordinary general meeting of the Institution of Automobile Engineers will be held on Wednesday next, at the Institution, Storey's Gate, St. James's Park, London, S.W.1, at 8 p.m., when Mr. E. L. Bass will read his paper entitled "Engine Lubrication." This paper is by a graduate and was awarded the Daimler Premium, one of the conditions of which provides that the successful paper shall be read. Cards of invitation for the use of visitors may be obtained on application to the Secretary of the Institution, 28, Victoria Street, London, S.W.1.

### A Belgian Six Days Trials.

A six days trial is to be organised by the Royal Moto-Club of Liége to be run on the lines of the Swiss Six Days event. Naturally, as it will be a long-distance trial, it will not be held entirely in Belgium, but will probably extend to Nice *via* Gap.

### Revs. and Speed.

Not many riders who speak glibly of the 60 m.p.h. speeds attained by their machines take the trouble to express the figure in terms of r.p.m. The average small two-stroke, for example, does not "rev." usefully much beyond 2,800 r.p.m., so that, on a 5½ to 1 gear, the speed will be 40 m.p.h. as a maximum.

### The Motor Cycle and Crime.

Motor cyclists are disgraced by three masked riders who entered a branch of the Royal Bank of Scotland, held up the staff, and stole about £2,000. Hitherto the motor cycle has not been used extensively as an accessory of crime. The machine was a Sunbeam.

### Motor Cycle Taxes in Italy.

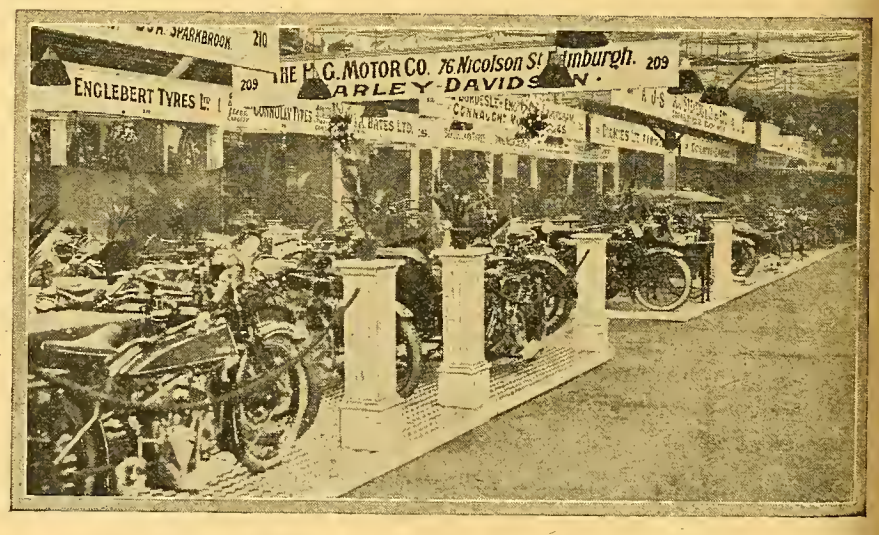
Motor cycle taxation is low in Italy. A 3½ h.p. machine is taxed 78 lire (15s.), or with a sidecar attached 110 lire (22s.), an 8 h.p. sports model is charged at 143 lire (28s. 6d.), and with a sidecar 201 lire (40s. 2d.). As at the moment of writing 97 lire go to the pound, the Italian motor cyclist gets off cheaply.

### This Year's Paris-Nice Trial.

Entries for the Paris-Nice Trial close the 10th inst. This year the event will be organised by the club at the Nice end of the run, but entries may be sent either to the President, Moto-Club de Nice, 11, Place Wilson, Nice; *Moto-revue*, 5, Rue Saint-Augustin, Paris; or *L'Auto*, 10, Faubourg-Montmartre, Paris.

### R.E. Signals Reunion Dinner.

The London Signals and associated companies (T.F.) are holding a private reunion dinner at 7 p.m. on Saturday next, the 4th, at the Florence Restaurant, Rupert Street, Leicester Square. Old members who have not received notification of this and are desirous of attending should join the gathering there, when tickets (11s. 6d. each) may be obtained from Mr. E. H. McCormack or Mr. H. Perkins. Capt. H. A. Crawford, R.E., will take the chair.



Some of the motor cycle exhibits at the Kelvin Hall, Glasgow, where the Scottish Motor Show is being held.

### An Irish Show?

A movement is afoot to organise a motor show in Dublin during the month of February, 1923.

### T.T. Helmets in International Speed Trials.

There is a rumour that T.T. helmets may be compulsory in all open speed trials held under international rules, and that the matter will be discussed at the next F.I.C.M. meeting at Geneva.

### Motor Cycle Racing Track for Italy.

The construction of a motor cycle racing track, which will be known as the Moto-Velodroma Partenopeo, is proposed at Naples. The track will be constructed of reinforced concrete, while the area which it encloses will be suitable for foot races and other sports.

### Drivers' Signals.

The chief constable of Bristol, writing to *The Western Daily Press*, remarks that some drivers of vehicles fail to give any signal as to their intentions. He gives the following hints and suggestions:

In some instances a wrong signal is given by those who wish to turn to the left, which is dangerous.

When approaching a point constable, the driver of a vehicle should never take his eye off the constable, until clear of him, and if his route be one of divergence from the traffic stream, he should make the direction he wishes to take quite clear to the constable, and in good time.

The importance of the use of signals has now been well tested and approved. They should, first, always be given from the right-hand side of the vehicle; and, secondly, in ample time to be of any use.

The code of signals for motor drivers is as follows:

Stop—Right forearm vertical.

Turning to Right—Right arm horizontal.

Turning to Left—Right arm horizontal, and then swept to the left.

Slow Down—Right arm horizontal, palm of hand downwards, and moved slowly up and down.

Pass—Right arm waved low down from rear to front, two or three times.

FOR HORSE DRIVERS.

Turning—Whip rotated above head.

Stop—Whip raised vertically.

GIVE SIGNALS IN TIME.

Too much importance cannot be attached to drivers of horse-drawn vehicles giving their signals well in advance of their contemplated action. The giving of a signal and putting it into operation immediately after is one cause of a great number of accidents, the fast-moving traffic coming behind not being given a chance to clear.

(15–16)

### Another Re-union Dinner.

It is proposed to hold a re-union dinner in London for the members of the 4th Motor Ambulance Convoy about the middle of February; all members interested should communicate at once with either Mr. Oliver Clark or Mr. B. Alan Hill, at 58, Great Portland Street, London, W.1.

### An Ally of the Public.

Speaking in Birmingham recently, Mr. F. E. Baker, of Precision engine fame, said that in the motor cycle Press the public had an indispensable ally. Criticism of any make of machine was always made without fear, and suggestions to the manufacturer as to the ways of improving his machines were frequently given. He was sure that everyone, including himself, looked forward to these comments, and, in many cases worked upon them.

### Motor Cycles in Italy.

Italy is one of the countries on the Continent where the motor cycle has been taken up with enthusiasm, and there are quite seventeen different native makes. While the good points of the leading British makes have been followed, the Italian designer has not omitted to give scope to his originality, and in most cases without producing anything which might be described as freakish in the slightest degree. The three-wheeler also has not been neglected.

A STUDY IN GREY AND WHITE. An A.J.S. owner who rightly appreciates the motor cycle in winter as well as in the summer.

### Touring in Spain.

*Apropos* our paragraph in the issue of January 19th regarding facilities at Behobia on the Franco-Spanish frontier, touring motor cyclists have reason to congratulate themselves because at all other Spanish frontier stations, apparently, owners of motor cars have to deposit a duty of £1,000 before being allowed to enter, owing to the recent excessive smuggling of motor cars. Motor cycle owners are only charged a duty which amounts to 1s. 2d. per lb. weight for a motor bicycle, and £1 19s. per cwt. for a sidecar outfit.

### A Prospective Visitor.

An Italian manufacturer, who has recently established a record on one of his own machines is anxious to place a few further records to his credit, and it is believed that his machine will shortly be sent to Brooklands, where its rider will make attempts to improve his own previous performance. Although our source of information does not mention the make of machine, it is to be surmised that it is Della Ferrara, whose record for the kilometre tied with that of Judd on the Norton, 25.9s., 138.99 k.p.h. (86.37 m.p.h.) in Class C (500 c.c.)

### Many Bargains.

After twelve months of high prices, the time appears to have returned when the motor cyclist can again buy some of his smaller necessities at genuine bargain prices. At the moment the shops and stores are filled with goggles, gloves, leather coats, boots, waterproof covers, tools, and heaps of other things, mostly surplus W.D., at tempting figures.

### An Enterprising Mayor.

A motoring daily in France is highly delighted because the mayor of a certain Commune in the Department de l'Oise has written to its editor informing him that up to the present he has taken no steps to regulate the motor traffic in his Commune, and would be very much obliged if the said editor would draw up a few practical regulations!

### "The Danger is Obvious."

Maj. Stenson Cook, the Secretary of the A.A. and M.U., writes: "May I appeal to every motorist, through your columns, when driving at night never to leave a motor vehicle standing with lights on on the off side of the road, even if it is necessary to turn it round in order to avoid doing so. When a car or motor cycle stands on the 'wrong' side of the road, with its head or side lights on, the natural tendency of the oncoming motorist is to drive to the left of those lights. The danger is obvious."

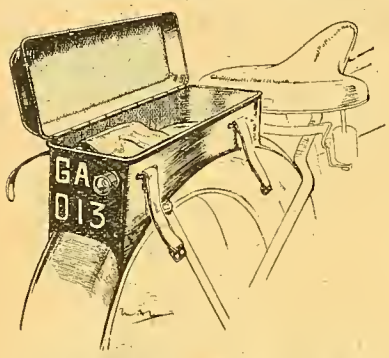
c 13

# IMPRESSIONS OF THE SCOTTISH SHOW.

## Several Scottish Productions. An Enthusiastically Attended Exhibition.

ON Friday last, at the Kelvin Hall, Glasgow, Lord Blythswood, with a few well-chosen words, opened the first Scottish Motor Show officially supported by the motor cycle manufacturers. In the past their representation has been left to the enterprise of the Scottish agents, who usually staged a few motor cycles with their car exhibits.

That this year's exhibition should have the practical support of "the trade" goes to show that the manufacturers are fully alive to the sales possibilities of their products across the Border; and we do not think they will regret their



Pressed steel tool locker on the rear mud guard of the Royal Scot. The back of the box forms the number plate and carries the tail lamp.

action in this matter, for the Scotsman is a great sportsman and has shown much keenness for motoring in all its branches. He possesses a country eminently suited for motor cycle touring; in fact, in some parts very badly served with railways, the motor cycle has proved itself as the best possible means of transport, and thus to the Scotsman it has become something more than a luxury.

### Scottish Opinions.

Opinions among the agents as to the desirability of a show in Glasgow were by no means unanimous; some expressed the view that the one national show at Olympia is all that is necessary; they

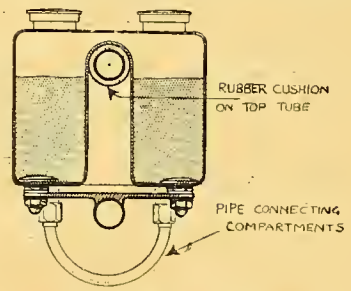
**The last issue of "The Motor Cycle" contained a comprehensive Guide to the Exhibits at the Kelvin Hall. The following impressions supplement our remarks last week, and refer generally to the Scottish productions on exhibition.**

contend that more than 50 per cent. of the Scottish motor cycle public attend the London Show, and they further argue that, after attending Olympia, the Scottish motor cyclist with his characteristic "canniness" says to himself, "A' weel, I'll wait and see what they have to show me at Glasgow," this attitude causing a stagnation of trade for the two months between the exhibitions. There may be something in this.

Opinion is also divided on the question of venue, which is only natural, for the Edinburgh man would obviously prefer the show in his own city. But his turn may come next year, for there is a scheme on foot to provide Edinburgh with a building suitable for such an exhibition.

### Scottish Exhibits.

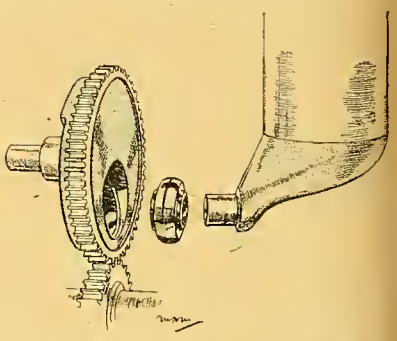
Interest is added to the show by the fact that some of the exhibits are of Scottish origin, three of them, the Carlton, the New Gerrard, and the Overdale, are not entirely national, for they went south for their power units. The Carlton is a Villiers-engined two-stroke machine made by the North British Machine Co., of Glasgow; it is quite a compact little mount and should receive much attention, as the single-geared machine is only £39 18s. Another model, with two-speed, clutch, and kick-starter, is priced at £53.



Section of the saddle-type petrol tank on the Royal Scot.

### A New Name.

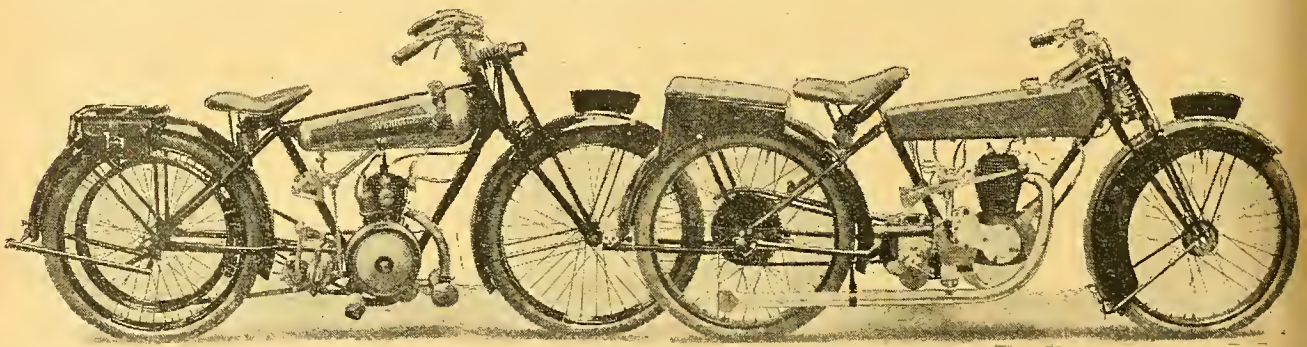
The New Gerrard Company is showing no less than six models: a 2½ h.p. machine with Villiers engine, chain-cum-belt drive, two-speed gear, etc., at £45; a 2¾ h.p. utility model, with 293 c.c. J.A.P. engine, Showell mechanical oil pump, and two-speed gear, at £59 10s.; and two other nominally 2¾ h.p. models,



New ball joint in the sleeve operation replacing the ball bearing hitherto used on the Barr and Stroud engine.

one with a 350 c.c. J.A.P. sports engine, all-chain drive, and a three-speed Burman box, at 79 guineas; the other, fitted with the 348 c.c. overhead valve Blackburne unit, at 93 guineas. Two larger machines are the 3½ h.p. sports and the 4 h.p. touring types, both J.A.P. engines, all-chain drive and mechanical lubrication. The latter has a light side-car fitted. Altogether, the makers, Porters Motors, of Edinburgh, have produced six well turned out and pleasing machines.

In the Overdale we again find a Villiers two-stroke engine in a machine of the runabout type, which should compete very well with others of its class.



Left: The Villiers-engined 2½ h.p. Overdale. Right: More than one interesting feature is incorporated in this model of the Royal Scot. Maplestone forks and the capacious tool-box-cum-carrier are worthy of note.

**Impressions of the Scottish Show.—**

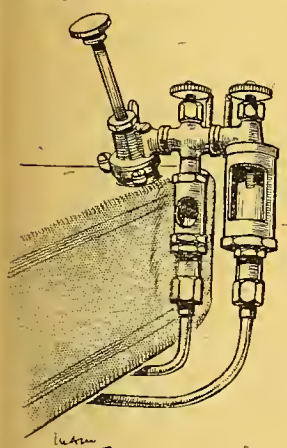
The Royal Scot and Gri can claim to be home productions; both are of considerable interest in that they are fitted with power units of unorthodox type. We have already described both these machines, although some recapitulation may be necessary in the case of the Gri, for it has not been much before the public eye lately. In place of the conventional type of valve mechanism the flow of gases is cotrolled by a rotary distribution valve working in conjunction with a single compression retaining poppet valve. Great simplicity is obtained by mounting the cam for the latter on the rotating valve, which is driven by a single enclosed chain. This chain also drives the magneto.

Perhaps the best known Scottish make is the Victoria, which is always on view at Olympia. A full range of models is exhibited at the Kelvin Hall, and, as is to be expected, attracts considerable attention.

On the whole, last week's issue of *The Motor Cycle* presented an admirable guide to the motor cycle exhibits, and last minute additions, either of fresh makes or models, were few.

Twenty of the well-known English manufacturers supported the show with exhibits of their own, these in some cases being well augmented by local agents. This duplication is no doubt a good thing for the makers, but to the buyer it is rather confusing. With one or two exceptions, all these firms were represented at the Olympia Show, and, except that their display is, of course, on a smaller scale, their machines remain as then, no important modifications in design being apparent.

Alexanders, Ltd., however, have an interesting machine in the new Diamond fitted with a sleeve valve Barr and Stroud engine. It would seem that this finely finished product of the Glasgow house will take a front rank position among proprietary engines, for quite a number



Twin drip feed lubricators on the Gri. The small one feeds the rotating valve in the cylinder head; the larger one leads to the crank case.

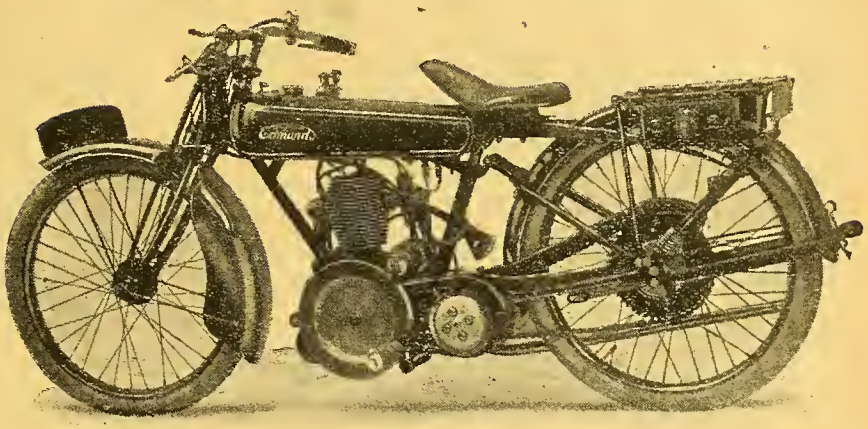
of makers are fitting it. Douglas Alexander was very enthusiastic about its possibilities, and is already talking of it as a possible mount for the next T.T.

The Zenith-Bradshaw models shown by Alexanders are also attracting great attention on a stand which has probably a bigger variety of machines than any other. Another much-visited make on this stand is the Levis.

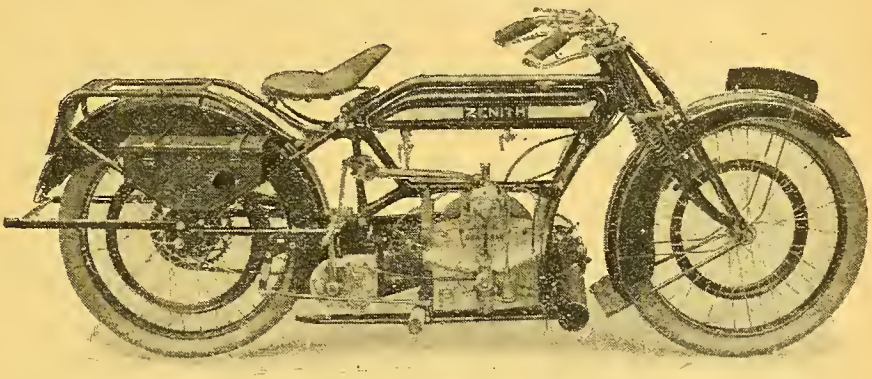
Douglas-Deans, Ltd., of Glasgow, are staging a varied display of well-known makes, including examples of the Sun-Vitesse model with rotary inlet valve in the crank case, and representative Ariel types, for which this firm holds the principle Scottish agency.

To sum up, this first-officially supported show, despite various little differences of opinion amongst the agents, may be judged a success, for it is being well attended daily.

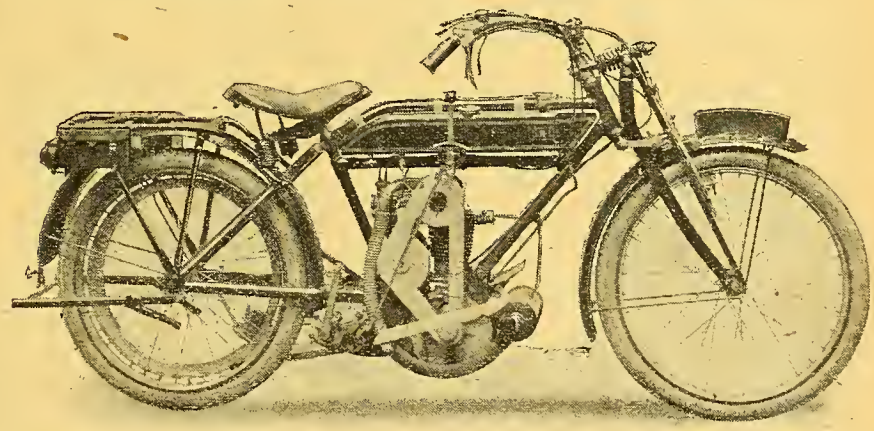
THREE UNCONVENTIONAL ENGINES AT THE SCOTTISH SHOW.



By reason of the design of the Edmund spring frame, it readily adapts itself to an attractive looking sporting mount, as is shown in this new Barr and Stroud engined model, which is used for demonstration purposes outside the Kelvin Hall.

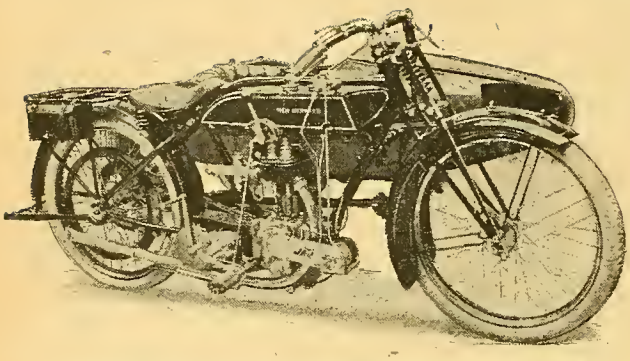


One of the attractions of the Scottish Show: the oil-cooled Zenith-Bradshaw.

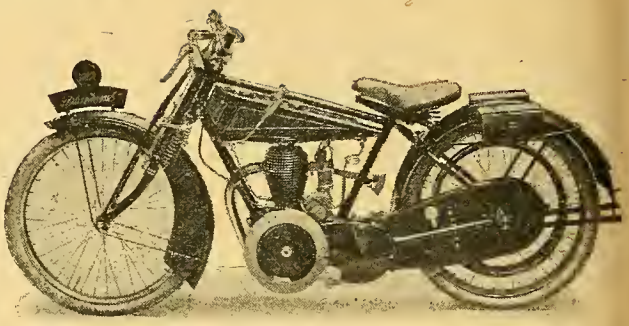


Combined overhead rotary and poppet valve gear, driven by roller chain, distinguishes the Gri engine, which is a Scottish production.

## AT THE SCOTTISH SHOW.



Distinctly sporting lines are followed in the New Gerrard lightweight sidecar outfit—a Scottish production.



So neatly have the chains been enclosed on the B. and S.-engined Diamond that the machine retains a true "sporting" effect.

## Cleaning Leather Coats.

SEVERAL of our readers have asked recently for a method of cleaning leather coats, and the following notes, submitted by a correspondent, who compresses much information into the following brief phrases, should, therefore, be of interest.

"Leather jackets can be cleaned with a lukewarm solution of soda water; this removes grease. A fairly strong solution of strong liquid ammonia with water added will also clean them perhaps better than the first-named recipe.

"After cleaning with either, let dry, then mix strong liquid ammonia and milk with a little water added so that ammonia is not too strong; this will put a nice face on the leather if applied when coat is dry. If a little Cherry Blossom or other good make of brown boot polish is brushed lightly on top of this, it will further improve the appearance. If a coat has black marks on, caused by ink, say, a medium strength solution of oxalic acid will take them out, while petrol or benzine will probably remove hard caked tar, etc., previously scraping or skimming with a warm thin knife. A badly discoloured brown coat will look better if dyed black; any kind of black dye sold by shoemakers will do. After washing, clean with soft soap and warm water, allow to dry and then wipe with soda water, before applying dye, finally brushing with boot polish (any colour will do) as the dye dries dull; brushing with boot polish will do good at intervals at any time, and help to keep wet from penetrating.

### Repairs.

"In the case of cuts or holes appearing, get some leather patching as near as possible the same colour as coat (this can be bought from most boot repairers), cut a patch the right size to cover the hole, skim the patch all round to a feather edge, and rough the coat where the patch has to be put with coarse sandpaper or a fine penknife, get some Necol patching solution from a bootmaker (a tube costs a shilling) and use according to instructions. I have tried all other kinds of gutta-percha and other solutions for patching leather and found all of them useless except this; patches applied with all others can be pulled off again. One cannot tear this off."

## Auto Cycle Union Notes.

IN his report concerning the North-West London M.C.C. open reliability trial to Gloucester, held on December 31st, Professor A. M. Low, who was the A.C.U. steward on that occasion, stated that, in his opinion, the average speed in trials held after dark should be seventeen miles an hour.

* * *

The Competitions Committee has considered correspondence with reference to the proposed dates of the T.T. races, and, after confirming the dates of May 30th and June 1st, instructed the secretary to proceed with the issue of the preliminary regulations.

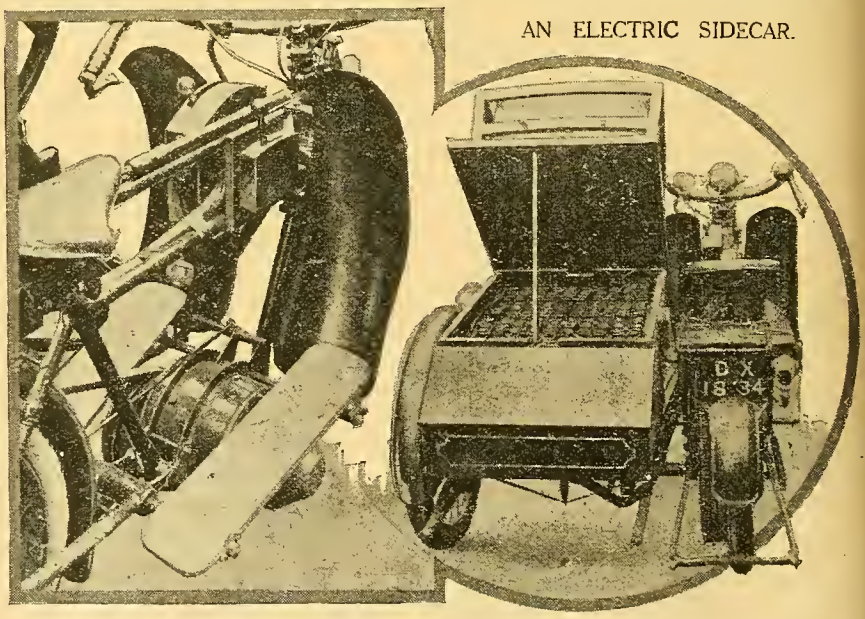
* * *

A silver cigarette box was recently presented to the Rev. E. P. Greenhill, late chairman of the Competitions Committee, by his fellow members of that Committee.

## 1922 500 Mile Race.

ONE of the most successful events held last year was the 500 miles race for the 200 guinea gold cup presented by Capt. A. G. Miller. This trophy was won outright by the Hendee Manufacturing Co., who handed it over to their brilliant rider, H. le Vack. We understand that the donor of the cup does not intend to offer another trophy this year and that certain agents in the motor cycle world are offering to put up a prize. We are asked for suggestions from our readers as to what form this prize should take, whether a single award for the fastest rider irrespective of class, or whether separate prizes for the winners of each of the five classes. We are given to understand that guarantees towards the cost, amounting to £240, have been received from members of the retail trade who appreciate the value of such a race to the motor cycle community.

## AN ELECTRIC SIDECAR.



A quaint vehicle used as a town runabout by the staff of Ransome, Sims & Jefferies, makers of the "Orwell" electric lorries. It can do 30 m.p.h., and runs 50 miles on one charge. It has been converted from an old-type Rudge.

## SUCCESS OF "THE MOTOR CYCLE" FILM.

**22 Applications; 28 clubs have already held Exhibitions; 45 further dates booked.**

*The Motor Cycle* film is proving a wonderful success. Up to last night it had been shown by twenty-eight different clubs—in several of the earlier dates for two or more days. It has been exhibited to approximately seventy-five audiences of, at a conservative estimate, an average of 900 people; and thus, including its week at the Polytechnic Cinema, London, it has been seen by about 70,000 spectators.

Forty-five clubs have yet to be visited, so that before it is withdrawn from circulation well over 200,000 should have seen and enjoyed this unique screen record of last year's important motor cycle competitions.

One hundred and twenty-two applications have been received in all, forty-nine of which we have had regretfully to refuse; for, although the film is already being duplicated, it cannot be expected to last such heavy service without showing some signs of wear towards the end. We have, therefore, decided to limit the number of dates we allot in accordance with the time which the films may be expected to remain in good condition.

Appreciations reach us from practically every club which shows it. For example, Mr. T. H. Sandland, the honorary secretary of the Widnes M.C., wrote recently: "On behalf of my club, I have much pleasure in thanking you for the loan of your wonderful film, which we had shown at the Co-operative Hall, Widnes, to a full house. It was greatly appreciated by all present, and all declare it was *par excellence* and could not be approached for thrilling incidents. And, although we had a heavy snowstorm the same night, we had several present who journeyed miles to see your inestimable film; they declared the journey was well worth it.

Each week we endeavour, as completely as the information passed on to us permits, to acquaint our readers of where the film may be seen during the following seven days. To-night the film will be shown at the Electric Theatre, Stocksbridge, on behalf of the local motor cycle club; to-morrow night the Sheffield University M.C.C. is arranging an exhibition in the Mappin Hall of the University; and on Saturday the Nottingham and District M.C. and L.C.C. will show it in Nottingham instead of the Derby club, which was unable to arrange a suitable hall.

---

## 40 MILES—30 OBSERVERS.

TO find the most skilful solo rider in the Coventry and Warwickshire Motor Club, a half-day "semi-freak" trial will be held on Saturday, the 11th inst., entries closing on Saturday the 4th inst. Only solo machines are eligible, and, indeed, it is understood that most of the course is impossible to any double track outfit. Some idea of the severity of the route may be gained by the fact that, although the course is only forty miles in length, no less than thirty checkers will be required to observe the competitors.

## THE MOTOR CYCLIST'S DIARY FOR 1922.

**A List of important Open Events. Reliability and Speed Trials organised by the different A.C.U. centres and those to be held by individual clubs are not included.**

| Arbuthnot Trophy, date not yet decided. | |

## PRICES OF SECOND-HAND MOTOR CYCLES.

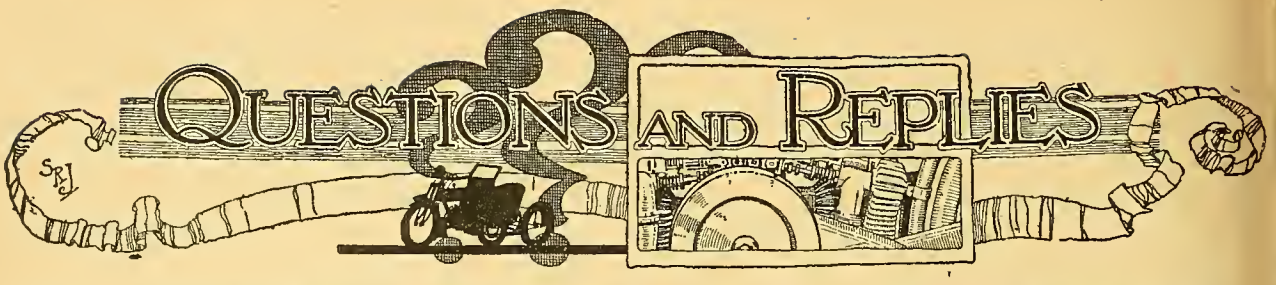
**MANY ATTRACTIVE BARGAINS.**

LIKE our weather conditions recently, the second-hand motor cycle market has been very unstable; it is quite impossible to observe any definite tendency of prices either to rise or fall since the last table of average figures published in *The Motor Cycle* of January 12th. Indeed, it seems likely that this is simply a case of cause and effect.

Consecutive cycles of snow, rain, frost, and mild sunshine are not calculated to make one think of the open road, and, although spring is drawing near, evidently the majority of potential buyers of motor cycles, new or second-hand, are delaying action until more settled weather conditions arrive. The unwisdom of this plan it is not our present intention to discuss, but it must be emphasised that, amongst the varied and in many cases anomalous prices quoted for machines in the classified advertisements in last week's issue of *The Motor Cycle* fully 40% are genuine bargains.

It is difficult at any time to arrive at a really fair average price for any particular model, and at present it is extremely so. In one case, for example, only two dated and priced machines of a certain make and model were advertised—one a 1920 solo machine at £80, the other a 1920 sidecar outfit at £75. In compiling the following table we have endeavoured to avoid such misleading figures.

| Machine and Model. | Average Price. £ |
|---|---|
| 3 h.p. A.B.C. (1920) | 87 |
| 7 h.p. A.J.S. sc. (1921) | 180 |
| 6 h.p. A.J.S. sc. (1920) | 129 |
| 2¾ h.p. Allon (1921) | 50 |
| 7-9 h.p. American X sc. (1920) | 80 |
| 3½ h.p. Ariel sc. (1920) | 70 |
| 3 h.p. Beardmore-Precision (1921) | 60 |
| 4 h.p. Blackburne (1921) | 75 |
| 4 h.p. Bradbury (1920) | 52 |
| 3½ h.p. Brough (1921) | 90 |
| 8 h.p. Brough Superior (1921) | 142 |
| 4¼ h.p. B.S.A. sc. (1921) | 112 |
| 4¼ h.p. B.S.A. sc. (1920) | 75 |
| 2½ h.p. Connaught sc. (1921) | 80 |
| 2¾ h.p. Douglas (1921) | 70 |
| 4 h.p. Douglas sc. (1920) | 80 |
| 8 h.p. Enfield sc. (1921) | 125 |
| 7-9 h.p. Harley-Davidson sc. (1920) | 105 |
| 10 h.p. Henderson sc. (1920) | 125 |
| 7-9 h.p. Indian sc. (1920) | 106 |
| 2¼ h.p. James (1920) | 33 |
| 7 h.p. James sc. (1921) | 145 |
| 6 h.p. Martinsyde sc. (1921) | 113 |
| 8 h.p. Matchless sc. (1921) | 140 |
| 8 h.p. New Imperial sc. (1920) | 90 |
| 3½ h.p. N.U.T. (1920) | 86 |
| 3½ h.p. Norton (1921) | 95 |
| 3½ h.p. P. and M. sc. (1921) | 112 |
| 4½ h.p. Quadrant sc. (1920) | 70 |
| 5-6 h.p. Raleigh sc. (1921) | 130 |
| 3½ h.p. Rover (1920) | 65 |
| 5-6 h.p. Rover sc. (1920) | 100 |
| 3½ h.p. Rudge-Multi (1921) | 73 |
| 3½ h.p. Sunbeam (1920) | 96 |
| 4 h.p. Triumph sc. (1921) | 110 |
| 4 h.p. Triumph sc. (1920) | 87 |
| 2¼ h.p. Velocette (1921) | 57 |
| 4 h.p. Verus (1921) | 78 |
| 6 h.p. Sports Zenith (1920) | 88 |



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the top left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

ROUTES.—By special arrangement with the Automobile Association and Motor Union, readers of "The Motor Cycle" desiring routes may enjoy the benefit of the Road Service Department of that organisation. Queries should be addressed to the Editor in the ordinary way (enclosing a 2d. stamp), and will be dealt with by the A.A. and M.U., who are regularly in receipt of reports from their representatives all over the country as to the existing state of the roads in any particular locality.

### LAW MUST NOT BE EVADED.

Could you please furnish me with dates of *The Motor Cycle* wherein references to the disadvantages of front brakes occur. I have been summoned for absence of a front brake, and wish to quote from some authoritative source as to its superfluity?—A.H.A.

Although references to the disadvantages of certain types of front brakes have been made in our pages, it is not impossible to have a soundly designed fitment which is efficient. In any case, the disadvantages of any particular type is no excuse for disregarding the law which requires that a machine shall be equipped with two separate and independent brakes.

### SOME ROAD GRADIENTS.

As a reader of *The Motor Cycle*, I would be obliged if you could tell me what is the gradient (in the steepest part) of Blue Bank, which is between Pickering and Whitby, on the moorland road; also the gradient of Mamm Tor Hill, near Castleton, Derbyshire, and, finally, the gradient from Edale, over the moorland road, to Chapel-en-le-Frith, in Derbyshire?—W.N.

The gradients of Blue Bank (between Pickering and Whitby), are given in the Gall and Inglis Contour-book as 1 in 17, 14, 9, and 7. The gradients of Mam Tor, in Derbyshire, are given as varying between 1 in 17 and 1 in 11. We have been unable to trace any published gradient of the third hill you mention.

### BIG ENGINES AND HIGH GEARS.

Some time ago I saw a photograph of a 20 h.p. motor cycle with a gear ratio of 1¾ to 1. What are the difficulties in the way of going still further in this direction, and adopting the ordinary bicycle practice of over-gearing these machines, and having a gear ratio of 1 to 3, and so on, whereby much greater speeds might be attained?—H.S.

The gear ratios for any machine have to be selected in order to make use of the maximum power developed by the engine, this being dependent upon the most favourable rate of engine revolutions. Provided an engine of sufficiently large capacity was used, no doubt it would be possible to employ over gearing, but the engine would be of an extremely heavy and slow running type.

## Important Dates.

**Fri., Jan. 27th, to Sat., Feb. 4th—Scottish Car and Motor Cycle Show.**
**Sat., Feb. 25th—Colmore Cup Trial.**
**Sat., Feb. 25th, to Sunday, Mar. 5th—Brusseis Motor Cycle Show.**
**Wed., Mar. 1st, to Sun., Mar. 5th—Paris—Nice Trial.**
**Sun., Mar. 5th—Argenteuil Hill-climb (France).**
**Mon., Mar. 6th—La Turbie Hill-climb (Nice).**
**Wed., Mar. 15th—A.C.U. One-day Trial for Stock Machines.**
**Sat., Mar. 18th—Victory Cup Trial.**
**Thurs., Mar. 23rd—East Midland Centre A.C.U. Open Reliability Trial.**
**Sat., Mar. 25th, to Sun., April 9th—Tour de France.**
**Sat., April 1st—Western Centre A.C.U.—Open Reliability Trial.**
**Sat., April 8th—B.M.C.R.C., Members' Meeting at Brooklands.**
**Fri., April 14th, and Sat., April 15th.—M.C.C. London-Land's End Run.**
**Sat., April 22nd—N.-Eastern Centre A.C.U. Open Reliability Trial.**
**Sat., April 29th—S. Midland Centre A.C.U. Open Hill-climb.**
**Mon., May 1st, to Sat., May 6th—Scottish Six Days Reliability Trials.**
**Sat., May 13th—Northern Centre A.C.U. Open Reliability Trial.**
**Sat., May 20th—S.-Western Centre A.C.U. Open Reliability Trial.**
**Tues., May 30th—Junior Tourist Trophy Race.**
**Thurs. June 1st—Senior Tourist Trophy Race.**
**Fri., June 2nd, and Sat., June 3rd—M.C.C. London-Edinburgh Run.**

### TUNING A RUDGE.

How can I improve the maximum speed of my 3½ h.p. Rudge-Multi, without making many internal alterations to the engine? (1) Would fitting a special carburetter do so? (2) Fitting an aluminium piston; would I have to rebalance the engine? (3) Boring holes in the connecting rod, thus lightening it? Can you suggest any other alterations?—J.K.D.C.

(1) No doubt a carburetter specially tuned for racing would give you some improvement. (2 and 3.) These matters are largely experimental, and it does not follow that the indiscriminate fitting of an aluminium piston and drilling the connecting rod will give you increased speed.

### THE GREEN PRECISION ENGINE.

Will you kindly let me know who are the makers of the "Regal-Green" engine, and if they are still in existence?—J.A.R.

Regal-Green machines are no longer made, but the Green-Precision water-cooled engine which was fitted was produced by F. E. Baker, Ltd., King's Norton, Birmingham.

### SOME MIXED FIGURES.

I wish to raise the top gear of my 500c.c. Coventry Eagle motor cycle. It appears to be about 8 to 1 at present (set for sidecar use). Engine sprocket, 12 teeth; gear sprocket, 35 teeth; countershaft belt pulley, 8in. diameter; wheel pulley or rim, 19in. diameter. What size of engine sprocket shall I get to make the top gear 4¼ or 4½ to 1, whichever suits the maker's sprockets.—N.S.B.

You do not give the date of your machine, but if it is a recent one, we are rather at a loss to understand the figures you give. Sturmey-Archer gear boxes have been the standard fitting on the Coventry Eagle for some time, and on these the clutch sprocket has 30 T. It is most unlikely that anyone would gear such a machine 8 to 1 on top, and, in any case, you have made some mistake in your measurements, as the sizes given represent a ratio of slightly higher than 7 to 1. Instructions on the determination of gear ratios and the number of teeth required on the various sprockets are to be found in the latest edition of "Motor Cycles and How to Manage Them."

### CHOOSING A MACHINE.

Will you please advise me about the purchase of a new machine to take a sidecar in a district with hills of about 1 in 11? Easy starting and freedom from trouble are essentials. Will 4 or 4½ h.p. be enough?—A.W.J. (Derby.)

Any first-class make of 4 to 4½ h.p. single-cylinder machine would propel a sidecar in your district with comparative ease. If you purchase a chain driven machine it would be advisable to get one fitted with an efficient shock absorber, otherwise a chain-cum-belt drive would be more satisfactory. Ease of starting is characteristic of almost all singles, especially those on which a decompresser is fitted.

### AN OLD LIGHTWEIGHT.

The engine of my single-geared machine is a rather old 2¾ h.p. four-stroke, which gets along all right on a level road. When it comes to a hill, however, it gradually slows down, and eventually stops in a very lazy and powerless sort of way, the opening of the throttle not appearing to increase the power at all. To test the compression, I placed the machine on the stand, and, revolving the wheel in the normal direction, found that the compression was rather weak. If, however, the wheel is revolved in the opposite direction, the compression is comparatively good, offering a springy resistance. Can you tell me the reason of this? There is, however, a distinct "click" each time a valve rises, or, more correctly, when it falls, especially the inlet valve, but when revolved in the ordinary direction no noise is heard. It appears to come from the cam raising the tappet rod. Is this a sign that the cams are worn? Also, can you tell me how often the crank case should be drained of oil, and how much oil must be placed in the crank case after this has been done? (Lubrication is by hand pump only.) Another thing which I do not understand is this. The magneto is driven by chain from the half-time shaft, both chain sprockets being the same size. The magneto, therefore, makes one revolution to two of the engine, *i.e.*, to one cycle. The contact points, however, make once and break once in each revolution, and therefore two sparks are produced while only one is needed. Does the second spark occur at the top of the exhaust stroke, and therefore produce no effect? If so, I should have thought it would be far better to reduce the magneto sprocket to half engine sprocket size, and thus produce only one spark.—A.C.S.

The resistance you observe when rotating the engine backwards may be due to the actual shape of the cams themselves, and not necessarily to them being worn. The crank case might be drained of oil about every 500 miles, and after this has been done three full charges of the hand pump should be given. If the magneto runs at half engine speed, and it has only one cam in the contact breaker casing, it will only give one spark per two revolutions of the engine. The spark only occurs when the points separate, not when they close again. Without further details we cannot make any suggestion with regard to the falling off in power of your engine when hill-climbing. You cannot, of course, expect abnormal performances from a small engine when only single-geared.

### KNOCKING WHEN STARTING.

My machine, a 1912 3½ h.p. Triumph, knocks when starting. I put it down to the sparking plug, but on fitting a new one I found very little improvement. The plug has recently been decarbonised and is in good order. Would you tell me my trouble?—A.J.

The information you give is not nearly sufficient to permit of a useful answer. The knocking may be due to the ignition being too far advanced, or it may be that the jet is rather small, and that the mixture is weak until the engine warms up.

### WHY SOME MEN ARE SPEED WIZARDS.

I was particularly interested in the two letters on "Which is the Fastest Norton Model," appearing in *The Motor Cycle* recently. Messrs. Norton Motors, Ltd., say their B.S and B.R.S. engines are specially tuned and built with one end in view—power development—without which speed is, of course, impossible. As an ordinary motor cyclist who takes a pride in trying to keep his machine in trim or tune, I take it that tuning means: (1.) The adjustment of valves with regard to opening and closing at certain periods of the cycle. (2.) The strength of the valve springs. (3.) Lift of valves. (4.) Size of jet or jets. (5) Compression ratio. The above-mentioned five points, I suppose, would require alterations for, say: (1.) Speed tests. (2.) Hill-climbing. (3.) Petrol consumption. (4) Slow running. I feel sure there are hundreds of motor cyclists who would welcome exhaustive information on this mystic subject of tuning.—CURIOUS.

The points you mention are certainly the most essential features of tuning an engine, but the questions of weight of reciprocating parts and balance also have some bearing on the matter; and, as you suppose, variations have to be made to suit special varieties of competition, such as hill-climbs, speed tests, or consumption trials, etc. Knowledge on the subject of tuning for really high speeds is almost entirely in the hands of a few experts, who employ their own particular methods, and guard them very jealously. It may be said, however, that there is no royal road to success in tuning for speed events, and the whole subject is a matter for continual experiment and adjustment, taking infinite care with every detail in the process. The impossibility of collating any complete information on the subject is also manifest, when certain methods will give good results on one machine, yet the same methods applied even to another machine similar in design prove to be quite hopeless.

### PETROL AND OIL CONSUMPTION OF A SINGLE.

(1.) What is the oil consumption of a 1921 4¼ h.p. B.S.A. ridden solo? (2.) What is the petrol consumption? (3.) What speed should be obtained from this engine? I use about one pint of oil for fifty miles on straightaway runs, and the petrol consumption is about 65 m.p.g. with the jet opened a half turn (threequarters for hills). The engine has ample power and does not smoke, only on full throttle when climbing on top gear.—H W B.

(1.) You should be able to do about 800 to 1,000 miles to the gallon of oil. (2.) From 65 to 85 m.p.g., although much better consumptions are by no means impossible. (3.) 45 to 55 m.p.h.

### ENGINE SHAFT GEAR FOR MACHINE WITH CLUTCH HUB.

Having just purchased a 3½ h.p. Triumph with hub clutch, which pulley do you recommend, a Philipson pulley or an N S U. two-speed pulley for light sidecar work?—H.C.

The Philipson pulley is quite a satisfactory arrangement, as is the Bradbury (N.S.U. pattern) two-speed gear also. It is impossible to recommend one in preference to the other, but you can get a slightly lower gear ratio with the latter. Its low gear, of course, is a positive reduction in ratio, whereas the Philipson is continually varying according to the load and speed. As you already have a clutch, however, the Philipson should serve your purpose, and if you order one with a touring governor no extra control is added to the machine.

IN PLACE OF THE "PAIR OF GREYS."

Though not by any means the first motor cycle wedding, it is rare to find all the guests being conveyed to church by motor cycle as well as the bride and bridegroom. The illustration depicts the sidecar outfits used at the wedding of Mr. and Mrs. F. Foster, of Thornton Heath.

### BRAKES AND THE LAW.

Is a 7-9 h.p. Indian, having internal and external brakes on the rear wheel, only within the law, or should each wheel be fitted with a brake? Is there a suitable front brake on the market?—J.W.M.

The law requires that a machine shall have two independent brakes, each one capable of locking the wheel; it does not specify that they shall be on separate wheels, therefore you are quite in order with the two brakes on the rear wheel only.

## READERS' REPLIES.

### HUB GEAR TO COUNTERSHAFT CONVERSION.

In *The Motor Cycle* of the 19th inst I note a query on page 90 re fitting back stays to a 5-6 h.p. Rex in place of the hub gear. I own a 1912 6 h.p. Rex with two-speed hub, and was thinking of this conversion myself, when a friend of mine recently called with a 3½ h.p. Ariel outfit (1919 model), and I found that the complete rear part of the Ariel would fit the Rex if the top back stays were lengthened about 2in. This conversion of course includes wheel, three-speed gear box, etc.—"REXBEAM."

### FOR A LEGLESS RIDER.

If your correspondent will get in touch with The Disabled Society, 48, Grosvenor Square, London, W.1., they will be able to give all the advice he requires concerning the alterations of a car to meet the needs of his unfortunate demands.—F. HARRIS.

In view of the query under the above title, we think you may be interested to know that we have in hand several Harper runabouts for cripples, two of whom have never previously seen a machine, which could be adapted to their particular requirements. In one instance the legless inquirer has decided to purchase a Harper runabout as soon as he can get delivery, and the only modification it will be necessary for him to make is the introduction on the handle-bar of a hand clutch lever and a hand brake lever. After these additions are made only three levers in all are fitted to the handle-bar, *i.e.*, throttle, clutch, and brakes. The engine is started by a convenient hand lever on the left-hand side of the machine, which lever passes through a gate automatically, upon the starting of the engine, and becomes a rachet side brake.—ARMSTRONG GRAHAM, R. H. Carlisle and Co., Ltd.

## EXPERIENCES WANTED.

*Readers' replies to questions published under this heading should be addressed c/o The Editor, "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4, when they will be forwarded direct to the querists concerned.*

"H.T.F." (London, E.17).—7-9 h.p. three-speed Rudge, solo and with light sidecar: Speed; consumption; climbing; and general remarks.

"F.B. (Manchester).—1920 or 1921 3 h.p. A.B.C.: Reliability; durability (especially o.h.v. and timing gear); suitability for everyday use.

"H.S.D." (Yeovil).—Zenith - Bradshaw and A.B.C.: Stability on grease and with pillion passenger; speed; reliability; consumption.

"I." (Glasgow).—3 h.p. Ivy with sidecar: General reliability; speed; ease of starting from cold; detachability of sidecar; consumption; climbing; reliability of chain drive.

"J.W.B." (Bayswater).—Most efficient carburetter for 1 h.p. Auto-Wheel: Economy; power; reliability.

"H.S." (Heighington).—Family Morgan: Speed, comfort, climbing on 5 and 11 to 1 ratios; advisability of four-speed gear; stability and wear of rear tyre; consumption (oil and petrol) of 10 h.p. water-cooled M.A.G. engine.

"A.D." (Kelso).—2¾ h.p. Douglas: Climbing, speed, reliability on long journeys.

"J.R.W." (Hove).—New Imperial lightweight: Reliability, comfort on long tours, general experiences 1921 models.

"J.G.D." (North Tawton).—Binks's carburetter on 4 h.p. Norton; improved consumption; slow running and acceleration.

"Novice" (Lemington - on - Tyne).—Chemical decarbonisers and puncture-sealing tyre fillings.

"Multi" (Manchester).—Conversion of 3½ h.p. Rudge-Multi to three-speed countershaft; gear box used; ratios; transmission; vibration of engine on lower ratios; climbing and general running with sidecar.

"F.P." (Brighton).—1921 Enfield: Consumption, speed, climbing, gear control, lubrication, and cooling.

"J.H." (Newcastle-on-Tyne).—Simplex, Young, or similar attachment; general experiences.

"E.W.V.F." (Oundle).—Best mechanical pump on 1921 3½ h.p. Sunbeam: Consumption and economy obtained thereby.

"H.C." (Highgate).—Alldays Allon: M.p.g., speed, general reliability, possible improvements.

"C.H.L." (Brondesbury Park).—Coulson and Edmund springing systems; Blackburne engined sidecar outfits.

"D.W.R.S." (Teddington).—Flexekas fitments on valve stems of Douglas: Elimination of rattle.

"L.G." (West Bromwich).—Levis, single-speed: Climbing, average and maximum speeds; consumption, Showell pump as an advantage over drip feed.

"L.G." (West Bromwich).—Morgan: Advantage of *de luxe* over standard, hill-climbing, average and maximum speeds, oil and petrol consumption, air or water-cooling, life of tyres and chains; comfort with two adults and one child.

"Rover" (Bucks).—1917 3½ h.p. Rover with sidecar: Reliability, speed, climbing, consumption, etc.

"H.C." (Worcester Park).—3 h.p. Ivy and 2½ h.p. Levis: Speed, m.p.g., reliability, general upkeep (both solo).

"P.C." (Salisbury). — Rudge-Multi: Speed, climbing, belt slip, general reliability.

"D.A.B." (Streatham).—4 h.p. Blackburne: General experiences solo and sidecar.

"F.E.H." (Sheffield).—4½ h.p. Quadrant sidecar: Reliability, oil and petrol consumption, average speeds, cooling, climbing, brakes, and general criticisms.

### Running Spares.

Useful sets of spares and replacements for the various models of the New Imperial machines are being marketed by New Imperial Cycles, Ltd., of Princip Street, Birmingham. Each set contains the most likely things the rider will need on the road or in the garage in a year's riding.

### Cleaning Leather Coats.

Many of those who have enquired recently for a method of cleaning leather coats will be interested to learn that we have had a good report from a reader regarding Propert's saddle soap; we do not know the makers of this preparation, but it is obtainable from most saddlery dealers.

### Taxi-sidecars for Cardiff.

At a meeting of the Swansea Watch Committee on Tuesday, the receipt of letters from the County Cycle and Motor Co., Ltd., and the James Cycle Co., Ltd., both of Birmingham, asking for the views of the Committee on the question of motor cycle taxicabs was reported by the chief constable. After some discussion, it was agreed that the licensing of such motor vehicles be approved.

### Echoes of the Christmas Trials.

In justice to his Levis machine, P. Pike wishes it to be known that he retired at Exeter in the London-Exeter run on account of receiving news that his daughter was seriously ill and that his presence was needed in Plymouth.

In the London-Exeter, V. Gayford, riding a 3½ h.p. Zenith-Bradshaw, gained a gold medal, and not a silver as we reported, while in the London-Gloucester, J. Wallis (7-9 Reading-Standard), who figured on the original awards list as a second-class prize winner, ultimately received a silver cup.

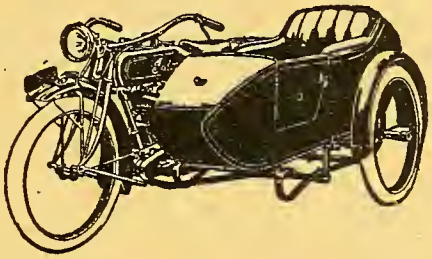
An amendment must also be made to the first published results of the London-Gloucester trial in that F. G. Morgan, riding a 2¾ h.p. Cotton, received a silver cup instead of the second class award with which he was previously credited.

### Catalogues Received.

Sparkbrook Manufacturing Co., Ltd., Coventry: Sparkbrook and Spark motor cycles and Sparkbrook pedal cycles are dealt with in one twenty-four page book. The motor cycles described are the 2½ h.p. two-stroke Sparkbrook, the 2¾ h.p. four-stroke Jap-engined semi-sports model, and the 2½ h.p. light two-stroke Spark, which is sold at a very competitive price.

Dunlop Rubber Co., Ltd., Aston Cross, Birmingham: A booklet containing some useful information regarding Dunlop cord tyres, which are made in the following sizes: 26×2½in. to fit the B.B. rim, 26×3in. to fit the C.C.1 rim, or 650×65 mm. rim, and the 700×80 mm. oversize, 28×3in. to fit the C.C.2 rim, and 28×3½in. to fit the 28 L.C. rim.

# ROCK BOTTOM PRICES at GODFREYS



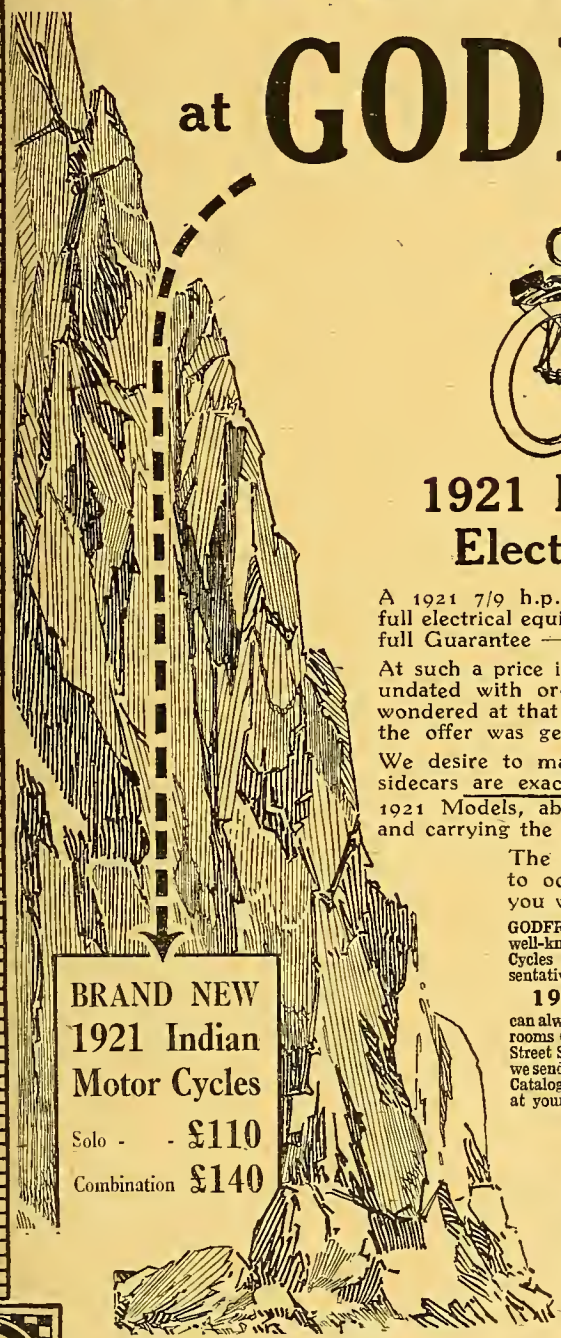
## 1921 Indians under cost. Electrically Equipped.

A 1921 7/9 h.p. INDIAN Powerplus Combination, with full electrical equipment, brand new and carrying the maker's full Guarantee ——————— For **£140 ! !**

At such a price it is not surprising that we have been inundated with orders and enquiries, nor is it greatly to be wondered at that certain cautious folk even doubted whether the offer was genuine until they actually saw the outfit.

We desire to make it quite clear that these machines and sidecars are exactly what we claim them to be, viz: late 1921 Models, absolutely new and unused, fully equipped, and carrying the maker's full guarantee.

The present offer is an opportunity not likely to occur again, and one which if you are wise you will profit by whilst you have the chance.



BRAND NEW
1921 Indian
Motor Cycles
Solo - - £110
Combination £140

GODFREYS are agents for all well-known makes of Motor Cycles and a large and representative stock of

**1922 MODELS**

can always be seen in their Showrooms (1 min. from Gt. Portland Street Station, Met. Rly.). May we send you our full Lists and any Catalogue you may wish to study at your leisure?

**CREDIT TERMS:**

We are always pleased to accommodate customers who do not wish to disturb Capital. Our charge is 4 per cent. (except in those cases where Manufacturers have fixed rates) and we deal direct and not through an agent.

## GODFREYS LTD.

208, GT. PORTLAND ST.,
LONDON, W.1.

*Telephone: LANGHAM 1300 (Two Lines).*

# That Old Cover

you were going to discard may yet, by careful retreading, be capable of many thousand extra miles. Send it to us and if the canvas is sound we will quote you the cost of retreading.

## BELDAM RETREADS

embody the same high quality of material and workmanship that goes to the making of the famous Beldam Tyres. Your covers are given a new, stout, well-built tread that is usually good for more than 5,000 miles.

We retread any make of tyre in the V-tread design. Here are a few prices :—

| | 26×2 ins. | 26×2½ ins. | 26×3 ins. |
|---|---|---|---|
| All Rubber: Extra Heavy Tread | 20/9 | 20/9 | 23/9 |
| „ „ Medium Tread | 17/9 | 17/9 | 20/9 |
| Steel-Studded | 39/- | 39/- | 42/- |

Re-lining, patches and bursts according to requirements. Full price list on application.

THE BELDAM TYRE CO., (1920) LTD., BRENTFORD, MIDDLESEX.
*Telephone Ealing* 125.

These are typical experiences.

*Bedford.*

*"Some two years ago you retreaded a 26×2½ tyre for me. This retread has now done over 8,000 miles and is still running. This tyre, an . . . . . , wore out in 2,118 miles and your retread is the finest I have ever had. I have another 26×2½ tyre which I want you to quote me for,"*

*F.S.B.*

*Lydford.*

*"We have dispatched to-day a Motor Cycle Cover. It belongs to client who says you retreaded a previous cover of his, which gave him a mileage of 8,000 before it wore out."*

*Bangor.*

*"I am pleased to say that the last two tyres I had retreaded with you have lasted longer than any new tyre I have had,"*

*J.P.*

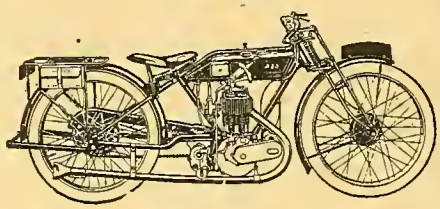
GET IT AT

TAYLORS

Sole London and District Distributing Agents for A.J.S., Excelsior, and Dunelt Motor Cycles.

A·J·S



**The famous A.J.S.,** which is now almost a household word, is available in two models only for the 1922 season—the 7 h.p. Combination at £175 and the 2¾ h.p. Touring, semi-sports, or stripped sports model at £85. These prices include carriage to nearest railway station. Supplied on the "payment out of income system," ¼ down and balance spread over 12 monthly instalments. May we send you full particulars?

DUNELT

TWO-STROKE

**Efficiency, Simplicity and Economy** sum up the Dunelt, which is a combination designed specially for the motor cyclist who desires to keep costs low. The 4½ h.p. Dunelt 2-stroke makes light of hills, it is simple to drive and easy to keep in trim, it has few working parts—no valves to grind or valve springs to break. The fitments are 3-speed gear, hand clutch and kick-starter, detachable and interchangeable wheels, roomy coachbuilt sidecar with locker of ample size in rear. Supplied complete with spare wheel and tyre for £29 18s. 6d., deposit and balance in 12 monthly payments of £7 6s. 8d., or £113 8s. for cash. May we give you a trial run?

"Excelsior"

**The Excelsior range for 1922** is very comprehensive. Models are available to suit all purses and desires. The single sporting 2-stroke is priced at £39 18s. and the 8 h.p. de luxe combination costs only £155. Full particulars gladly sent on request, also deferred payment terms.

**SPECIAL**

High-class second-hand machines in great variety are now available at bargain prices.

An Opportunity for Enterprising Agents.

THE MOTOR CYCLE

Insurance Policies

**IMPORTANT AGENCY EXTENSION**

SERVICE to your clients should include the best and most reliable Motor Cycle Insurance Agency it is possible to obtain.

The Policies you recommend should carry a name that inspires confidence and gives an assurance of prompt and generous settlement of claims.

From your own point of view it is desirable that you should represent a company that enjoys the highest reputation among the motoring public, and be able to offer policies that are known to give complete and comprehensive cover.

**An extension of the Agency and Service arrangements for "The Motor Cycle" policies is now being made, and applications are invited from agents who realise the value of specialised experience and the importance of maintaining the goodwill of their clients.**

Here is your opportunity of handling policies that every motor cyclist knows and the value of which he fully appreciates.

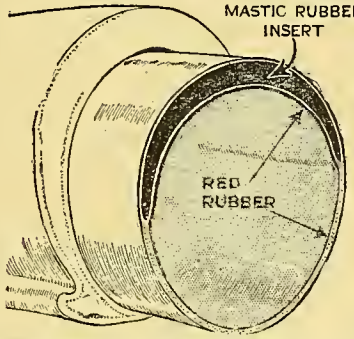
# PUNCTURE SEALING
! ! ! !
## CHALLENGER TUBES.



The only difference from an ordinary tube is that the tread portion is very slightly thicker and is built of three layers so adjusted as to be self-sealing; the centre layer being composed of the patent hole-proof composition, which instantly closes up when the nail or article causing the puncture is withdrawn.

EXCHANGE 1921 (Oct.) Carden, 2-seater, electric lighting, detachable wheels, spare wheel, almost like new, for Lightweight and cash, or sell; £85.—28, Woodford Rd., Forest Gate. 'Phone: Stratford 2598. [6814

9h.p. Temperino 2-seater, 3 speeds and reverse, live axle, hood, screen, electric and acetylene lighting, 1919, for late Combination and case, or sell £125 —De Cort and Flynn, 39, Essex Rd., London, N.1. [6695

EXCHANGE Trumhull car, 1915, 4-cylinder, new tyres, 15.9h.p., in perfect order, 2-seater, lamps, tools, licence first quarter, for Seal 3-wheeler or similar.—22, Fourth Ave., Selly Park, Birmingham. [7017

1921 Carden 2-seater, spare wheel, hood, screen, electric lighting, cost 150, run 200 miles; £85; exchange motor cycle, cash adjustment.—Junction Garage, Highstone, Leytonstone. 'Phone, Wanstead 403. [6795

LATE property of a Gentleman.—Metallurgique Landaulette, 25h.p., detachable rims, upholstered Bedford cord, Bosch mag., Zenith carb., for a first-class combination.—Full particulars to Central Ignition Works, 14a, Loughborough Rd., Brixton, London, S.W. [7040

8h.p. 3-wheel Runabout, W.C., 3 speeds and reverse, electric horn and lights, speedometer, windscreen, hood, car steering, etc.; £95; for good combination, level exchange.—Offers, 56, Brookville Rd., Fulham. [6354

£50 and upwards, and 6h.p. Twin "Rex," 2-speed gear, with coach-built sidecar, in splendid condition, for best combination offered (2-seater preferred). Expert examinations.—Box 8404, c/o *The Motor Cycle.* [6427

EXCHANGE 1920 2-seater, Kingsbury Junior, dynamo lighting, 2 spare wheels, nice appearance, any examination or trial run, for combination and cash, or sell; £165.—28, Woodford Rd., Forest Gate. 'Phone: Stratford 2598. [6815

EXCHANGES.—Newnham Motor Company, 223, Hammersmith Rd., London, always have large stock for exchange. Write full particulars your present machine. Post exchanges. Distance no object. —Newnham Motors, 223, Hammersmith Rd., London. [6772

4¼h.p. B.S.A. (1916) Combination, perfect order, nearly new tyres and tubes, C. and B. sidecar with extra strong chassis, and all complete, for higher power Matchless (preferred 1920-21), A.J.S., B.S.A., Sunbeam; cash adjustment arranged.—Hill, 41, Connaught Rd., Brookwood, Surrey. [6549

## REPAIRERS.

ANY

ARMSTRONG or Sturmey-Archer Gears Repaired promptly and efficiently.—County Engineering Co., Hounslow. [0517

TRIUMPH, Douglas, J.A.P. Repair Specialists.

OUR Works do nothing else but repair the above makes of machines. Cylinders rebored, new pistons fitted, engine and gear boxes overhauled. Enamelling, plating, all on the premises. Send your engines or gear boxes; bench test and road test before returning. No need to send complete machine. All spares in stock, and we are more prompt than the makers. Work guaranteed. We pay carriage one way. Discount to trade.—The Winstan-Henny Motor Co., 63, South End, Croydon. 'Phone: 2431. [4764

WHITTALL for Welding. Aluminium experts. Prompt delivery.

WHITTALL.—Pistons complete for Triumph, Premier, J.A.P., Bradbury, B.S.A., Douglas, Sunbeams, etc.; 14/- to 24/-, on approval, exact to pattern.

WHITTALL.—Cylinders reground and new complete pistons fitted from £2, perfection guaranteed. Twelve years' first-class reputation. Pistons to pattern or sketch.—Whittall Machinists Co., Whittell St., Birmingham. [0017

C. R. FOSTER, of Leeds, is the original cylinder grinding specialist.

CYLINDER Grinding by Foster, of Leeds, has no equal. Price, complete with piston, from £2.

£1,000 is the value of the machine and equipment that will grind your cylinder at our works.—Foster, of Leeds, 170, Cardigan Rd. [0003

ENGINE Overhauls, quality work only, cylinders reground, pistons, valves, bushes, etc.—Below.

PISTONS for every standard motor cycle in stock from 14/- each.—Below.

CYLINDER Grinding, our speciality 2¾h.p. Douglas reground, fitted with new piston, rings, and gudgeon, 25/- each.—Below.

TRIUMPH, J.A.P., Bradbury, and all 3½h.p., 4h.p., cylinders reground and fitted new piston, rings, and gudgeon, 35/-; returned in 48 hours.—Below.

QUALITY and Satisfaction is our motto. Entrust your work to specialists and get a guaranteed repair. — C.M.D. Engineering Co., Leamington Spa. 'Phone: 768. [9659

HUB Gears.—Great reductione in prices of replacements for Sturmey-Archer and Armstrong gears.

HUB Gears.—Wheels repaired and returned within the week; send for latest price lists.

HUB Gears.—Why pay an extortionate price for fitting a few new parts to an old gear?

HUB Gears.—We undertake to supply the complete new internal portion of the gear mechanism less main driver for £5.

HUB Gears.—A. F. Lewis, Charlestown, Weymouth. Look out for the Lewis patent 2-speed countershaft gear and clutch. [0747

ARMSTRONG and Sturmey-Archer Gear Specialists. Repairs while you wait.—Tavistock (below).

ARMSTRONG and Sturmey-Archer Gears completely assembled for 6/- in 2 hours.—Tavistock (below).

ARMSTRONG and Sturmey-Archer Parts at cut prices by return of post.—Tavistock (below).

GEARS, shafts, valves, etc., for car or cycle, made promptly.—Tavistock (below).

GEARS.—Send all gear repairs and replacements to Tavistock Engineering Co., 254a, Portobello Rd., North Kensington, London. 'Phone: Park 643. [3719

WHEELS Repaired, rebuilt; sidecar chassis repaired.—Pritchard, 7, All Saints Lane, Coventry. [X5307

WELDING Aluminium Crank Cases, gear boxes by experts; immediate attention; seasonable prices.—Below.

WELDING Broken Cylinders, flanges, combustion experts of 11 years' experience.—Below.

CYLINDER Grinding on latest machinery, installed since hostilities ceased; accuracy guaranteed; new pistons fitted.—Sadgrove and Co., 140, Conybere St., Birmingham. [4769

ENGINES Rebushed, overhauled, rings fitted, compression guaranteed; singles 30/-, twins 40/-; returned 3 days.—Below.

CYLINDERS Rebored, fitted with new pistons, from 30/- to 40/-.—Turner Bros., Motor Engineers, Summerseat, Manchester. [4143

FRAME and Chassis repairs, alterations, etc. We are specialists and sidecar makers; reasonable charges.—Below.

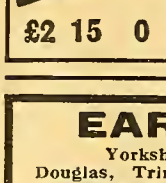
ENGINES overhauled, rebushed, singles, 35/-; twins, 45/-. Try us for anything motorish.—Henry V. Smith, Osmondthorpe Lane, Leeds. [6728

**STURMEY-ARCHER AND ARMSTRONG**
**Hub and Countershaft Gears repaired immediately.**
Every part for all types actually in stock. No waiting. Price List and Instruction Sheet by return of post. Usual trade terms. Send repairs to Putney Station, L. & S.W. Rly.
**CROMWELL ENGINEERING Co.**
327, PUTNEY BRIDGE ROAD, S.W.15.

**Preserve your Cylinder.**
**Withstands heat, petrol, and oil.**
Tins 1/2 and 2/-. post free.
**OWEN BROS. & Co. Ltd., HULL, England.**

**STURMEY-ARCHER and ARMSTRONG**
**Hub or Countershaft Gears repaired while you wait.**
Actually in Stock—New Sturmey-Archer Countershaft Gear and Boxes spare parts.
Send for illustrated list. Trade supplied.
Send wheels, Hounslow L.S.W. Railway.
**COUNTY ENGINEERING CO.,**
**64 Staines Road, HOUNSLOW.**
Wires: 'Three-speed, Hounslow.' 'Phone: Hounslow 322

**AFTER THAT DIRTY JOB**
**SNOWHYTE**
**will clean the hands with or without water and leave them soft and supple.**
*NO SAND OR GRIT IN SNOWHYTE.*
In tins, Car size, 1/- Cycle size, 6d.
From Garages, Cycle Stores, Ironmongers, etc.
SNOWHYTE Co., 1-3, Pocock St., LONDON, S.E.1.



**SANDUM V-shaped WINDSCREEN**
**Instantaneous Success.**
**The Talk of Olympia Show.**
**£2 15 0**
SANDUM SIDECARS, 336, Gray's Inn Road, W.C.1
'Phone: City 6982.

**EARNSHAW**
**Yorkshire service depot for Douglas, Triumph, Matchless, B.S.A., P. & M., Enfield, Rudge, Humber, Norton, Indian, Morgan, L.S.D., Coventry Premier, Etc., Etc.**
**HUDDERSFIELD.** 'Phone 1232.

## REPAIRERS.

STOVE-ENAMELLING.—Frames, 9/-; wheels, 9 tanks, makers' colours, plating.—De la Cour, 2 Kennington Rd., S.E.11. [65

FRAME, chassis, and tank repairs, enamelling & painting by experts; prompt deliveries.—Langh Co., Fitzroy St., Leicester. [60

INDIAN Owners.—If you have trouble with your m chine, send to Indian repair specialists, Dea 89, Brixton Rd., London. [18

J.A.P. and Blackburne Engine Experts; reasona and reliable.—Kingsbury Garage, Edgware R Hendon. 'Phone: Kingsbury 134. [42

FOR Expert Engine Overhauls, cylinder grindi new pistons, and spares, Hedley and Co., Fe St., Newcastle-on-Tyne. [13

P. and M. Gear Specialists. Any 1911 to 1921 P. & M. gear repaired promptly and efficiently.—A. Phillipson, Engineer, 1a, Hilda St., Grimsby. [38

GARAGE and Cycle Repairs, Bromley, Kent. Sto tools, and fittings, all at £150; offers; leavi country.—Box 8,414, c/o *The Motor Cycle.* [68

ENGINES Overhauled, rebushed, cylinders regrou new pistons fitted, frame repairs, etc., low possible prices.—Winterton, Brechford, Birmingham. [64

ENAMELLING, Plating.—Tanks enamelled as befo handle-bars, etc., plated.—Send to Murray's Plati Works, Union St., Coventry. Platers and enamellers the trade. [00

CYLINDER Grinding, new pistons, etc.; accur and highly finished work; prompt delivery; pr list on application.—W. and F. Wills, Ltd., Enginee Bridgwater. [07

YOUR Tank re-enamelled; makers' colours, corr designs, transfers, guaranteed; handlebars, et plated; lists.—Park Works, 1a, Paradise Rd., Hi bury, N.5. [60

SPEEDOMETER Experts.—Repairs to all make Stewart repairs a speciality. New and second-ha sets in stock.—London Speedometer Co., Kramer Me Earl's Court. [40

FRAMES.—Repairs and alterations; special fram and tanks built, any design; enamelling & plating.—A. Pilkington and Co., 390, Lichfield R Birmingham. [84

FRAME Repair Specialists.—New tubes, lorks, sta cut-downs, etc.; enamelling and plating at low prices; quick despatch.—A. E. and F. Brittain, Bentl Lane, Walsall. [26

ROC 2-speed overhauls, Humber, Rex, Vinde V.S., Alldays, Campion; spares stocked; & licencee for all Roc 2-speed gears.—Connolly, Carmel Rd., Coventry. [70

ALUMINALLOY Pistons. — Our pistons signal efficiency for 20,000 miles. Cylinders groun pistons fitted. Trade supplied.—Commercial Engineeri South St., Keighley. [39

ENAMELLING, Plating, Brazing, tanks origin colours from 6/-; motor cycles renovated throug out; parts plated from £6.—Fisher, Works, 111, Ha nall Lane East, Coventry. [63

CYLINDER Grinding, new pistons, rings, a gudgeons, 85 mm. J.A.P.'s, etc., 29/6; other siz on request. Aluminium pistons if desired. — Vulc Engineering Works, Walsden. [96

N.S.U. N.S.U. N.S.U. Gears repaired at qui notice. Spare parts in stock; send gear alo to us.—Butterworth Garage, 64, Mill Lane, Brixt Hill. 'Phone: Streatham 2813. [65

WELDING.—Broken flanges, aluminium crank case cracked water jackets, valve seatings, weld and machined complete; scored bores filled in & ground to existing pistons.—Below.

CYLINDERS Reground, new pistons fitted complet in cast iron or aluminium.—West London Wel ing Co., Essex Place, Chiswick. 'Phone: Chiswi 536. [04

COULSON Repair Specialists. Spares for all mode stocked. Trade inquiries invited. Tube bendin welding, brazing, and enamelling.—H.W.H. Engineeri Co., 40, Old Town, Clapham, S.W.4. [25

CYLINDERS Regrounnd, accurate finish, compre sion guaranteed; Triumph, Rover, Premier, 35/ 2¾h.p. Douglas, 25/-; 70 mm. bores, 30/-; rings a gudgeons complete, twins low price.—Below.

PISTONS, all patterns, oversize specialists, l price.—Below.

PISTON Rings, oversize or slip-cut, 2/-; standar 1/6; return post; none better. Thousands testimonials.—Patent Rings, 30, Wigan Rd., Atherto [51

SPRING Fork Repairs and Replacements. specialise in these and can execute to any ma at half manufacturers' prices; 2-day service.—Ja Lucas, 110, Williams Rd., Cannon Hill, Birmingha [63

## The Date of the Scottish Show.

WAS the date chosen for the Scottish Show the most propitious? Although a great success, and duly appreciated by a large section of the northern public, the Show has been criticised on one point: the date was not regarded with favour by Scottish agents. This was mentioned in our report in last week's issue.

From our conversations with prominent members of the trade in Scotland, we gathered that it is a conviction in the North that a large number of buyers who visited Olympia, with true Scottish cautiousness, withheld their orders until the Glasgow Show provided a further opportunity for examination. The net result of the Show, it is claimed, is that orders which would be given at Olympia are delayed. In other words, the Glasgow exhibition has tended to hold up business during December and January, when manufacturers should be busy preparing for the spring demand.

It would appear that to make a Scottish Show satisfactory to all concerned, it should be held immediately after the exhibition in London, when the manufacturers could transfer their Olympia models to the northern exhibition.

Next year there may also be the question of an Irish Show, to which the above remarks also apply to a large extent. Perhaps it could be arranged for this to follow the Scottish event, so that there would be no time wasted to the trade by periods of waiting, which are very detrimental to business of any description.

It may be argued that such matters are purely of trade interest, but a broader view should be taken, as by keeping the manufacturers employed all the year round—instead of at abnormal pressure for the spring and summer months—the cost of motor cycles must be decreased, as the output of a factory which is fully employed for six months only has to bear the heavy overhead charges for the whole year.

One cannot further hide the fact that multiplication of shows is in disfavour among a large section of the trade. One important and representative exhibition each year is, in many quarters, considered sufficient. Supplementary shows form a big drain upon the industry's resources, and tend, as we have already pointed out, to delay the placing of definite orders.

## Service and Sales.

IF certain motor cycle manufacturers could glance through our letter bag, there would, we are confident, be immediate and considerable improvements in the efficiency of their spare parts supply systems. We are not referring to the occasional complaints received, now happily becoming rarer, but to the daily eulogies of those firms which are becoming noted for their prompt and courteous repair and replacement service.

So many of these unsolicited testimonials do we receive that we have long given up attempting to publish them all; but so often do readers go as far as to aver their intentions of placing repeat orders simply on account of good factory service that, even at the risk of repetition, it seems justifiable to keep the fact before the public eye.

Good service and attention by the manufacturer *after* a machine has been disposed of, is the best form of advertisement. Motor cyclists are the keenest sportsmen in existence, and they are apt to talk rather freely. If, therefore, an enthusiastic user is obtained by prompt attention to orders for replacements, it is easy to recognise that such riders are in effect perpetual missionaries for the particular make of machine which they ride.

An index to the advertisements in this issue will be found on the page facing the back cover.

### "Upper" Lubrication.

DO you know what it is? I did not until this morning when I received a circular from a concern which is just entering the lubricating oil trade. It was written by a publicity expert. The preface fairly put the wind up me. It described the conditions ruling in the combustion chamber of a petrol engine in the vein of a thirsty soul who finds himself stranded in the Sahara, or newly arrived in New York without knowledge of the magic words which unlock the secret bars. Piston rings, I gathered, do their work so well that not one drop of oil ever reaches the combustion chamber. So the rings wear, the cylinder becomes oval, the valve stems bind in their guides, the piston melts, and the top portion of the engine is soon reduced to a number of white-hot 'bits of metal clanking against each other. I got quite frightened till I remembered that the paper was only an advertisement, and that I had oiled up two plugs the day before, in spite of these miraculously efficient piston rings. The sting of the folder came in the tail. To avert all the above catastrophes you should mix 2oz. of a particular oil with every 5 gallons of petrol, and this oil costs you 12s. 6d. Per gallon? Certainly not. Per *quart*. Let me justify the price by explaining that the oil is supposed to be fireproof. It not only does not burn itself, but keeps the engine so oily inside that common oils which *do* burn cannot cling to the greasy surfaces. If you find any carbon when you dismantle the engine you just mop it off with a duster. When I retire from journalism and produce the "Ixiona" super motor bike, I must get that "ad." writer for my staff. Hardened old cynic as I am, he first frightened me and then made me eager to splash 12s. 6d. on a quart of his wonderful oil. Had it been 12s. 6d. per gallon I fear I must have fallen.

### Some Odds and Ends.

WHEN I find a good thing I believe in putting other people on to it. Perhaps the best article I have encountered this winter is the Aquamac legging. It really keeps out downpours, which is more than many alleged waterproof twills can do; its seams are so cunningly constructed that no rain can drive past them; it has chains under the insteps in lieu of the usual fragile leather straps; and after you have pulled off the pressbuttons which secure its slit sides the trousers collapse in a heap round your bootsoles. Next in order of merit I should mention a Kaye oilcan, which is as strong as it is light. The Pidko twist grip is a very nice conversion fitting for those riders who like the American type of control on a British 'bus. I have previously stated that I am almost exclusively clad in ex-Government fabrics. My Sidcot suit keeps me warm in cars and cycle cars and sidecars—yes, even in the midday frost of January 24th—but is hardly proof enough for solo work in wet weather. When dismounted I wear one of Weston's trench coats—smart enough when new for Sunday work, and cheap enough to be good wear for tramp motor cycling when its twill exterior gets dirtied. Rubber hip boots are far and away the cosiest footwear for a cold day, and as disposal stuff at 12s. 6d. they are more economical than shoe leather. But you must have trousers wide enough to stop rain soaking into the boot tops, and I regret that my own feet are so large that I cannot get a pair of ordinary walking shoes into any of the stock sizes of rubber boots.

### Jet Controls.

IF 1921 has taught me anything it is the unparalleled value of a variable jet Nothing but the laziness of the public prevents these fittings being standardised by universal demand, for, having already two carburetter controls on the average motor cycle, John Citizen is dead against being bothered with a third. The result is that manufacturers experience a limited demand for the fitting, and as it must increase the cost of a carburetter quite appreciably the average carburetter maker prefers to push a fixed jet. But we are not all of us idle or untechnically minded Speaking for myself, I find that for nine-tenths of my mileage I prefer a small jet; it gives me all the speed and climb which I ordinarily want, plus real economy —possibly 110 m.p.g on a 500 c.c. four-stroke engine. For the remaining tenth of my mileage I care nothing about economy, but I yearn for lurid acceleration, intense speed, and terrific climb. This unrestrained tenth of my mileage being irregularly sandwiched into the more docile nine-tenths, changing a fixed jet occasionally does not fit my needs. I like to have jet control, so that a twitch of a lever converts my gentle tourist into a fire-eating road-burner. Those readers who have never tried a jet control should experiment with one in 1922.

### Automatic Oil Pumps.

OUR editorial pages and the advertisement columns combine to prove that quite a number of technical authorities believe in automatic lubrication, and that quite a lot of riders are experimenting by adding such fittings to standard machines

**Occasional Comments.—**

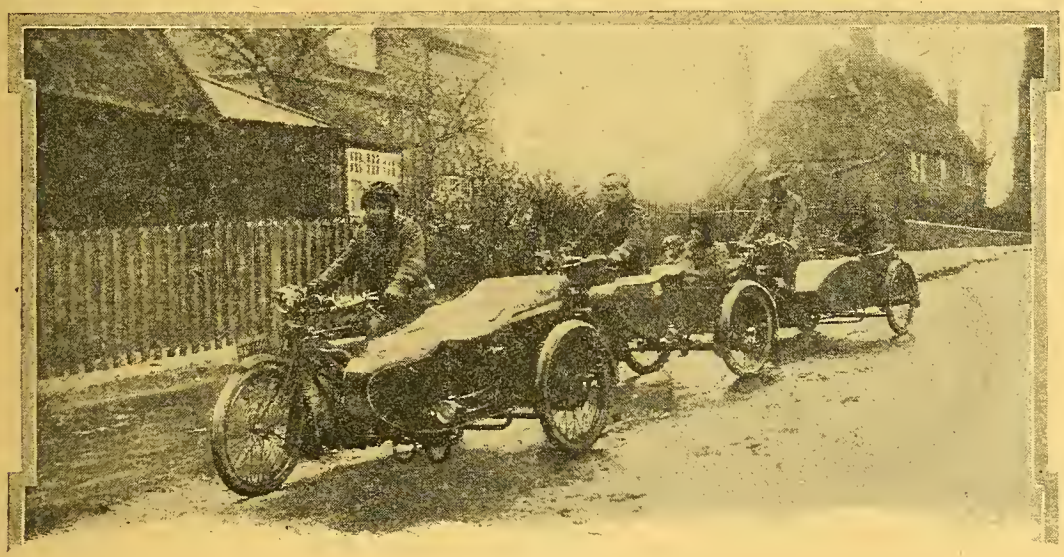
equipped by their makers with the ordinary hand pump or drip feed. Yet, odd to relate, I do not know a single rider who uses one of these accessories, nor have I ever met along the road an owner who had made the bold experiment. It would doubtless interest many readers if some of those who used these pumps last season would forward their verdicts on the subject. During the recent arctic snap I was caught with (i) a tank full of summer oil, and (ii) no inspection lamp on my oil drip. By day I had to dismount so often to coax the thick oil through to the engine that I travelled at night in a perfect fever of apprehension. I fell a-musing that my ideal 'bus would have, item, gravity pipes so fat that any oil would necessarily run through them, and, item, a pump which saw that the oil went where it is wanted. I warn readers who are apt to be casual that with the thermometer at 27° it is really difficult to induce even a "water-cooled" oil to quit the tank. I was only able to continue a recent ride in broad daylight by heating the oil in my tank, running it out, and replenishing with the sort of stuff which one uses to lubricate a multiple plate clutch or a sewing machine. The oil which my makers recommended for winter work would just leave the tank, but froze into a kind of grease as soon as it got into the cold pipe leading to my crankcase; that pipe silted up so hard in a few minutes that no amount of blowing would clear it, and I had to borrow Bowden wire at a garage to thread through it.

### Quite Interesting.

LIKE most motor cyclists, I can read anything with a petrolic flavour, but generally give the heavy stuff a miss. However, when 'flu had enabled me last night to exhaust all the light literature in the house, I pounced on the current issue of *Motor Transport*. Much to my surprise, I found it quite as interesting as the Blue 'Un. How many miles per gallon does a lorry do on petrol and eke on oil? I have often cursed the motor chars-à-bancs in the Dartmoor lanes, but a long article from the 'bus owner's standpoint has created new sympathies for them, especially when they are struggling with Devon gradients in a sea fog on the famous grease of those districts. Rather a wistful sort of boy discoursed pleasantly in another column of his early efforts to make a living with a Ford van. Further on I read how the motor lorry is ousting the camel in the matter of banana transport between orchard and sea. (Query: Do bananas grow in "orchards," or should it be "plantations"?) Then came a picture of S. F. Edge dispatching two famous piglings from his Ditchling herd to Strasbourg in a Goliath air liner. Finally I met an illustration of Glenn Curtiss' latest brain-wave—a motor 'bus with a hinge in the centre of its chassis so that it could turn corners quickly; this was no fit brain-fodder for a sick man with a temperature that suggests nightmares, so I put the journal hastily away; but I must become a regular reader when I have exorcised the 'flu demon.

### Semi-Diesel.

THE mysterious engines sold by Bramco, Ltd., of which I published the advertising slogan under the head of "Another Puzzle" on January 12th, are, of course, of the semi-Diesel type. They are started by compressed air, and utilise a compression of 450lb. per sq. in., which creates a temperature of approximately 1,000° F., at which any external ignition becomes "otiose," as the murderer remarked when they served a County Court writ on him in the condemned cell. One or two readers mistook my correspondent's inquiry for pure spoof. Thus one solution was: "How does the beastly thing go?" Answer: "It doesn't—it is a stationary engine." The Bramco people evidently became alarmed lest our readers should try to fit these engines to motor cycles, and hastily forwarded me a list, from which I gather that the smallest single-cylinder model weighs well over a ton. To soften the blow, they enclosed a split-pin puller for which they are agents. How I wish I had owned this tool in the evil days when it was my mournful fate to dismantle aero engines, disfigured by several gross of those necessary evils.

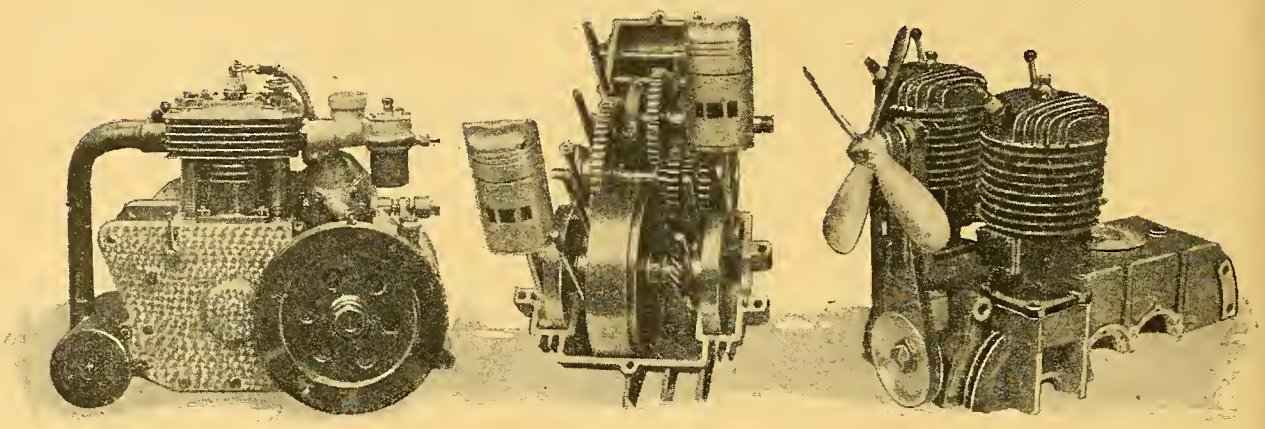


OFF FOR A WINTER RUN.

A hardy family party taking advantage of a brief spell of fine weather during the short February days. Although not comparable with spring, summer and autumn riding, a good deal of enjoyment is forthcoming even though the sky be grey, the lanes drip with moisture and the roads are heavy.

# FRENCH SIDE-BY-SIDE TWINS.

## Tendencies in Motor Cycle Design across the English Channel.



BLERIOT FOUR-STROKE AND TWO-STROKE SIDE-BY-SIDE TWINS.

Four-stroke unit showing belt pulley and valve arrangement.

Lower half of the Bleriot cycle-car engine-gear unit, showing pistons, cranks and gears.

Two-cylinder two-stroke, shown with lower portion of crank case detached

IN France there is a certain tendency for motor cycle engineers to follow motor car practice in the design of engine, clutch, and gear box. In other words instead of Vee type engines with chain drive to a change-speed mechanism specially designed for motor cycle use, and then chain or belt drive to the rear wheel, some designers are showing a preference for a twin-cylinder vertical engine, forming a unit with its clutch and gear box.

One of the best examples of this practice is to be found in the Viratelle machine, built at Lyons. The firm responsible for this has two models—a single-cylinder of 350 c.c., and a twin of twice the piston displacement, both of them being water-cooled. Although the Viratelle is not very well known outside its home country, the design is not altogether new, for this firm had a single-cylinder water-cooled model on the market as far back as 1906. The reply to the objection that this design makes for a heavier machine is that with the extensive use of aluminium the increase in weight is only slight, while the advantages are a more reliable and uniform cooling quite independent of the speed of the machine, complete protection for all the working parts, a greater degree of silence, and neater appearance.

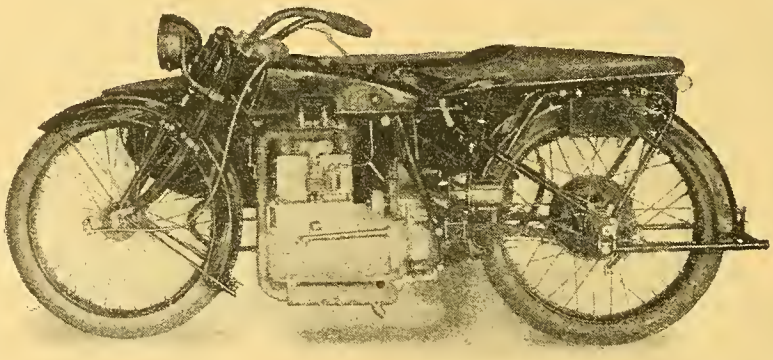
The Viratelle cylinders have a bore and stroke of 73 and 82 mm. respectively. On the twin-cylinder model the two cylinders are mounted side by side, across the machine, with the crankshaft throws at 360°. This means that so far as balance is concerned the Viratelle approximates to two single-cylinder engines, but when one piston is at the top of its compression stroke, the other has completed its exhaust stroke. This gives even firing.

On the twin Viratelle the flywheels are inside, between the two cranks. The shaft is carried in ball bearings, and roller bearings are used for the connecting rod big-ends. Side-by-side valves are used, the valve chamber being to the rear of the cylinder block, with the carburetter bolted up direct on the same side. The position itself gives protection to the valves, but this is further enhanced by a cover plate. As the engine is practically independent of a draught of air for its cooling, an adequate shield can be fitted in front of it for the protection of both the mechanism and the rider.

### A Fan within the Radiator.

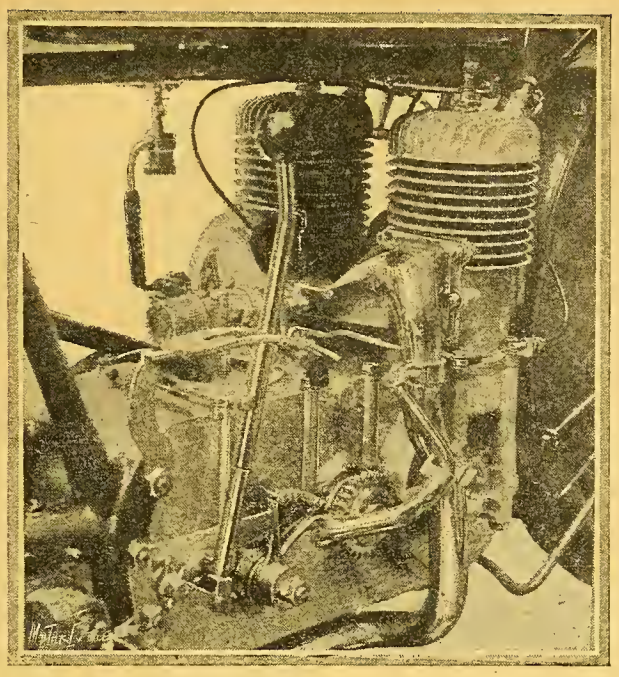
The radiator on the Viratelle machine is mounted in the frame, just ahead of the petrol tank, and is composed of circular copper tubes uniting two collector tanks. Water circulates by thermo-syphon, but cooling is further assured by a centrifugal fan in the radiator, driven in a very neat manner by an enclosed belt from the engine. About six pints of water are used for the twin-cylinder machine.

A three-speed planetary transmission is contained in the engine base



With its unit construction of engine, clutch and gear box and shaft drive, the Lutece is almost a motor car on two wheels.

**French Side-by-Side Twins.**—chamber of the Viratelle machine, the connection between the engine and the change-speed gear being by an intermediate pinion with spring coupling, the final drive to the rear wheel being by means of an enclosed chain. One of the outstanding features of this machine is the manner in which gear changes are made. The rider can select his gear in advance by the use of a lever on the handle-bar, and can bring it into engagement by pressing a pedal at the correct moment. The arrangement of the control levers on this machine is as follows: Left-hand handle-bar, valve lifter and clutch; right-hand handle-bar, change-speed lever, throttle and brake; left foot for the brake, and right foot for the lever which locks the planetary gears in engagement.

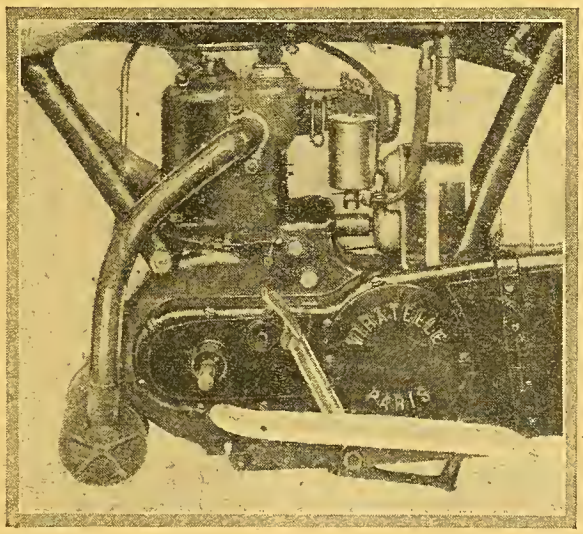


The Bleriot two-stroke side-by-side twin (minus the cooling fan) shown fitted in a motor cycle frame. This machine was exhibited at the Paris Show.

### Complete with Electric Starter.

Car practice is most closely approached in the Lutece machine, which has a unit construction engine, gear box, shaft and worm drive which might have been laid out for service on a four-wheeler. This machine has been built by an important French aviation company, or, it would be more correct to say, will be built by this company, for up to the present aviation contracts have prevented the firm going ahead on its motor cycle programme, and only a few machines exist in the hands of agents and demonstrators.

The Lutece has two vertical air-cooled cylinders mounted in line on an aluminium base chamber, which also forms the housing for the clutch, the three-speed gear with gate change, and the universal joint for the driveshaft. Mounted on the group, immediately behind the cylinders, is the combined electric generator and starter, which also provides current for ignition purposes (for no magneto is fitted), and even for heating. Car practice is followed even to the lubricating system, which is of the forced feed type, with all the oil in the base chamber, a gear pump delivering it through the hollow crankshaft to the main bearings and the big ends. The level of the oil is judged by a steel gauge attached to the combined filler and breather cap on the left-hand side of the base chamber.



The water-cooled Viratelle, which is made with both single and side-by-side twin cylinders.

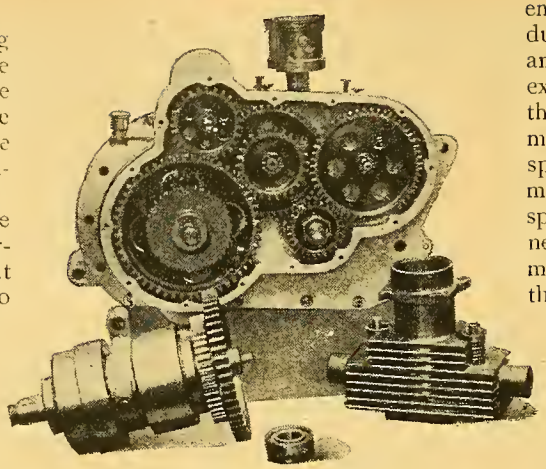
It has to be admitted that in this case car practice gives a remarkably neat machine. The cylinders, although separate, appear to be one block; the four valves are all on one side, protected by a detachable plate, and the carburetter bolted on the left-hand side with a Y-shaped intake manifold is as accessible as the most fastidious could desire.

With the very deep base chamber necessary to provide for a reserve of oil, the height from the top of the cylinders to the bottom of the base chamber is considerable, and tends to give a top-heavy appearance to the machine. One of the advantages of this design is the absence of oil leaks. There being no external oil pipes, there cannot be leaks at the connections. It is quite easy to make the joint between cylinders and crank case quite oil-tight, and there need be no leakage of any importance from the valve stem guides. The only other joint is that between the crank case and the oil reservoir forming the bottom portion of the case. This joint, however, is low down, under the aluminium footrests, and if any leak should occur here it will not splash on the rider's feet or legs.

Cylinder dimensions of the Lutece engine are 75 mm. bore, with a piston stroke of 113 mm. Very deep radiating fins are employed. The crankshaft is carried in ball bearings, while split type plain bearings are used for the connecting rods. Aluminium pistons are used, with three rings, one of these of the double type. The degree of silence is considerably enhanced by the mounting of the camshaft parallel with the crankshaft, connection between the two being by means of a silent chain,

**French Side-by-Side Twins.—** the general arrangement being similar to that adopted on the majority of car engines. On the first series to be produced the speedometer will be driven off the front end of the camshaft, instead of from the front wheel.

As in light car practice, the Lutece has a pair of quarter-elliptic leaf springs, attached at their forward and thick end to the gear box housing. The driveshaft is enclosed in a torque tube with a ball head at the forward end which allows for the rise and fall of the wheel in relation to the engine base. So far as the frame is concerned, there is comparatively little departure from standard practice.

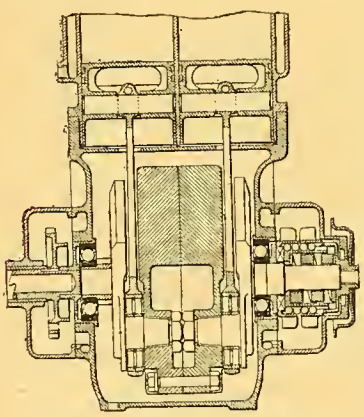


Bleriot twin four-stroke. Timing gear cover removed showing camshaft and magneto drive and how reduction is obtained between engine shaft and lay shaft. The T head type of cylinder is shown on the right.

Although there is no attempt to follow car design, the Blériot machine is a good example of the French practice of using two vertical cylinders and combining the change-speed gear with the engine. This machine has air-cooled cylinders set side by side, across the frame, with valves on opposite sides, the exhausts being in front and thus getting the direct current of air, and the intakes being towards the rear. The arrangement has much to recommend it, for the exhaust side, which needs most vigorous cooling, is in the direct current of air, while the carburetter is well protected behind the pair of cylinders.

### Cranks at 360°.

Bore and stroke of this engine are 60 and 88 mm. respectively, which brings it in the 500 c.c. class. The two throws of the crankshaft are in the same plane, or at 360°, as in the case of the Viratelle. The magneto is driven from a cross-shaft, and is mounted behind the group of cylinders, just under the intake manifold, in a well-protected but at the same time fairly accessible position. Use is made of the timing gears, contained in a housing on the right-hand side of the engine, to get the initial gear reduction, between the engine-shaft and the pulley-shaft. A rearward extension of the crank case forms the combined housing for the metal disc clutch and the change-speed mechanism. On the first models to be brought out only two speeds were provided, but a newer type about to go on the market has three speeds. From the lay shaft drive is transmitted to the rear wheel in the usual manner, by means of a belt. Except that disc wheels are standard, the other parts of the Blériot motor cycle do not show any departure from standard practice.

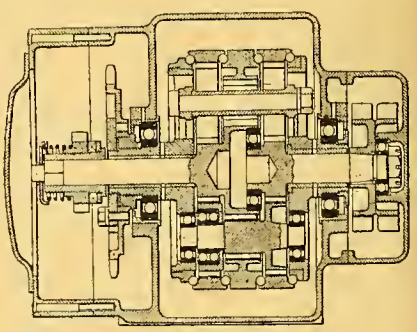


The Viratelle twin-cylinder side-by-side engine, with central flywheel.

There is another example of the twin vertical engine in the Blériot cycle car engine, which was exhibited at the Paris Salon in a motor cycle. It is of the two-stroke type with cylinders 70 × 96 mm. The two cylinders are mounted side by side on a common base chamber with sufficient space between them for the central flywheel, which also contains the disc clutch. In this case the cranks are opposed, or at 180°, whereas in the four-stroke they are in the same plane. An extension of the base chamber forms a housing for the change-speed mechanism, which provides three speeds and reverse. Final drive is by belt to the rear axle.

### Four Cylinders for Cycle Cars.

The majority of French cycle car designers appear to favour a small four-cylinder water-cooled engine in preference to the types evolved from motor cycles. One of the exceptions is the Françon, which is fitted with a twin-cylinder vertical two-stroke engine. It is rather remarkable that in France air-cooling appears to find very little, if any, favour for anything but motor cycles. The French makers of the Morgan specialise in the water-cooled model, and the firm making the G.N. in that country have thought it necessary to produce a four-cylinder water-cooled type in addition to the model with air-cooled engine.



The planetary three-speed mechanism and chain sprocket on the twin water-cooled Viratelle motor cycle.

## BAD ROADS IN SOUTH AFRICA.

In Natal the roads are in a terrible condition, and on a complaint being made by the Natal Automobile Club to the Engineer-Superintendent, a reply was received to the effect that as there were no funds some of the roads would have to remain rough and rutted. Natal motorists talk of refusing to pay the provincial motor tax until such time as the Council have the main roads put into a proper condition.

# BUYING A SECOND-HAND MACHINE.

## Advice to would-be Purchasers of used Motor Cycles. Processes of Elimination.

AT this time of the year thousands of our readers must be considering the purchase of a second-hand machine, usually because it is cheaper than a new mount. But although all prospective buyers of used motor cycles may thus be classified as seekers after the maximum value for the minimum expenditure, their requirements vary greatly in other respects. It is not easy to generalise on this matter.

Obviously what might apply with some force to the family man who has £150 wherewith to purchase a modern fully-equipped big twin-passenger outfit might be quite useless to a keen youngster who is looking for a 1911 Triumph at £25 with a view to extensive renovating operations. Yet, as we have emphasised already, both are equally anxious to get the utmost value for their money, and, therefore, much of what follows should interest all potential buyers who are not absolutely wedded to the current year's machine fetish.

### Advice to the Novice.

For the pure beginner, probably the best plan is to put himself entirely in the hands of a firm of reputable and well-established agents who make a speciality of selling motor cycles overhauled by themselves, telling them what he wants, or, better still, what he wants it for, and how much cash he has available for the purchase. He will probably pay 7-10% more than if he bought in the open market, but he will be assured of satisfaction, and, dealing with the leading firms, may rely on being safely "nursed" through any early troubles. A good business concern nowadays looks ahead, and a humble order for, say, a pre-war sidecar outfit is treated with just as much care and courtesy as if the purchase had been a 1922 Rolls-Royce—the latter may come later from the same source!

Considering next the case where the buyer feels fairly confident of his ability to make a good bargain, it cannot be too strongly emphasised that a little knowledge is a dangerous thing in any sphere of action, but doubly so on the second-hand motor cycle market. Not that there is an unduly large number of "sharks" to be avoided, but because it is quite possible to buy, from a perfectly honest seller, an entirely unsuitable machine which at any price would be expensive.

Therefore, the most important point is to choose rightly. Possibly the buyer has already settled on five or six makes which promise to give satisfaction; it is preferable to decide this first, and then to glance through the miscellaneous advertisements in *The Motor Cycle* to ascertain just how modern a model is available at his pre-determined figure.

Naturally, the longer and franker advertisements of the genuine private owner make the greater appeal; but some excellent bargains may be hidden in a two-line advertisement over a box number. Generally speaking, however, the owner's name and address and date, mileage, and price of the machine should be looked for.

It is then easy to pick out four or five possibilities, and since the market is not extremely active at present, there should be ample time to write each of the advertisers for fuller particulars. Engine and frame number should be obtained, and dates may then be verified by making application to the manufacturers concerned, who are usually very willing to supply this information.

### Inspecting the Final Selection.

The final choice should undoubtedly be made on personal inspection, and if the procedure indicated has been followed faithfully no very searching examination of mechanical features and general condition should be necessary. Again, it is difficult to generalise on what should be looked for. Little things, such as the presence or absence of lamps or tools, often make a greater difference to the value of a machine than the fact that the steering-head or wheel-bearings are slack. It should be definitely ascertained, too, whether the tax has been paid and for how long.

If a decision is made to purchase, it is well to part with no cash until the registration book has been produced; and a trial run is regarded as a *sine quâ non* by many. In the case of very old machines, the latter step is certainly advisable, but it may well be dispensed with when a little-used last year's model is under consideration.

Commonsense and an ability to judge the seller—and not so much his machine—usually lead to a more satisfactory purchase than a wonderful theoretical knowledge of motor cycles generally.

# THE OLD WYCHE ROAD.

AN enquiry was recently held at the Shire Hall, Worcester, concerning applications as to the closing of the Old Wyche Road by Mr. F. C. Cook, D.S.O., Inspector of the Ministry of Transport. The applications were opposed by Mr. C. Blewitt on behalf of the various organisations representing the interests of users of private cars, motor cycles, and commercial vehicles, and also the motor cycle trade.

In support of the applications in respect of the Old Wyche Road, which has been frequently used in motor cycle trials, the County and Urban District Council called eighteen witnesses, whose evidence chiefly related to the noise and interference with Church services when the road was used on Sundays, while with regard to danger only two cases of accidents were put forward. During the past year only six prosecutions for dangerous driving have been instituted, one of which was unsuccessful. Mr. Blewitt, on behalf of the motoring organisations, contended that the applicants had entirely failed to establish danger or unsuitability. The Ministry of Transport has not yet announced its decision.

## Early Activity on the Track. Surface Much Improved. A New Speed Aspirant?

ALTHOUGH the repairs had not finally been completed, Brooklands track was partially re-opened on Wednesday of last week, mainly, we were told, on account of the keenness of the motor cycle element among its patrons to be "at it" again.

It was a glorious, summer-like morning, but the rain of the night before still lay in puddles along the inner edge of the track, guiltily indicating that nearly two months' work and the use of many tons of concrete had failed to produce the billiard table surface still popularly and erroneously associated with Brooklands.

The roar of a healthy single drowning the buzz of two chain-driven Zenith-Bradshaws "on test" suggested that Judd or O'Donovan might be early arrivals, but enquiry revealed the somewhat surprising information that the machine was a P. & M. That the makers of such an essentially "slogging," touring type of mount should turn their attention to speed work for the first time after so many years of successful reliability performances is, to say the least, significant. While we were there, P. Cunningham on a stripped 3½ h.p. model, lapped at nearly 58 m.p.h., but, previously lap speeds of very much over the mile-a-minute mark had been obtained. It is realised the track is a great teacher, and, even should the P. & M. remain (almost exclusively) unobtainable as a sports model, much of value may be learned.

### An Early Start.

D. R. O'Donovan, the unassuming Norton wizard, and his most promising pupil, Judd, were also there—Brooklands would not be Brooklands without them—but not bent on any serious work, although the former gave us to understand that long-distance records would be in danger on the following week. The phrasing is ours, of course, not his.

O'Donovan is keenly interested in the question of an amateur T.T. race. He suggests Brooklands as a venue, and that standard stock machines, tuned only by their riders, be used. A half-serious proposal by our representative that the test hill be included was dismissed as too dangerous, although he agreed that the track might possibly be temporarily converted into a really "sporting" miniature I.O.M. course.

When on this subject it is worthy to mention that if the test hill were widened and then continued over the track by means of a substantial bridge it would be possible to add a mile of mixed going to each lap.

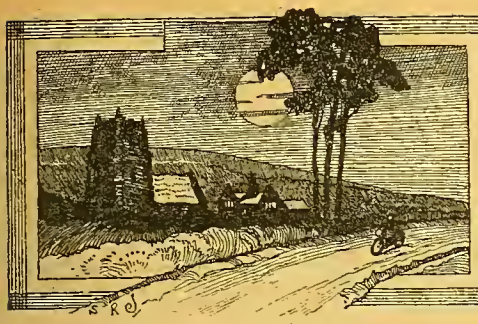
Competitors would race in the "reverse" direction, come round a hairpin bend at the fork, down the straight, up the test hill, round the outside of the track, through the tunnel, and back through the paddock and up the straight. An even better, but of course more expensive scheme would be to construct, in addition, an inner and an outer circle on the track itself and to connect them by a temporary bridge. The cost might be prohibitive and the danger element great, but imagine the "gates" that would be drawn! Football shares might even experience a slump.

### Round the Track.

However, to get back to the track as it is, our representative decided to make a personal examination awheel. His mount, a four-valve Triumph, had not yet reached its second hundred miles; so, bathing it with oil, he tried a lap at a cautious forty. This of course involved keeping well down off the banking, and here the going is roughest, for naturally water runs off less readily; however, it compared favourably with almost any road.

Having located the survivors of the repair gang, who were completing operations with brooms and scrapers, and finding no suspicion of overheating on the part of a new engine, another circuit was made at a considerably higher average, probably fifty, but at a maximum of 56 m.p.h. by Bonniksen. This time the banking proved to be in very fine condition, but the middle of the railway straight was none too good.

On the whole, therefore, the track may be classified as excellent, and to all appearances ready for very high speeds by either motor cycle or car. Without doubt some extraordinary figures will be attained.



# LIGHT ON THE LIGHTING PROBLEM.

## Acetylene, Accumulator, Dry-battery and Dynamo Systems Compared.

ALTHOUGH the days are growing longer, lamps are still a vital necessity. Whether we ride daily or only at week-ends, a lampless machine holds over us the threat of being compelled to train home in the event of some unexpected delay; or of having to start back early and miss some pleasant hours. There are three separate lighting systems which are worth consideration.

### Acetylene Generators.

The first is the old-fashioned gas head lamp with acetylene generator. Its chief merit is its cheapness. More ostentatious outfits have blinded people to the fact that a gas generator set is perfectly reliable in the hands of a man who will take the trouble to master the control of the water drip and to keep the lamp clean. When I use such a set, I do not fill the carbide chamber till the lamp is wanted, lest dust should choke the water valve; and I make a test to discover where the valve should be set to procure the desired "spotty" flow of water in blobs, as opposed to a practically continuous stream, which drowns the charge, and leaves the rider lightless. I am equally careful to cleanse the lamp thoroughly after each run. After these precautions a stop is unknown, except when a hard-worked burner gives out after many hours of use, or an all-night run exhausts the charge. Both these emergencies are catered for by carrying a little spare carbide and an extra burner. On these terms a generator set may be used all the year round without the least shadow of anxiety; and no system is so cheap. My one heresy with regard to gas generator sets is that the tail lamp is never too trustworthy. Solo machines are not now required to show a tail lamp in all districts, but the tail lamp makes for safety in two special circumstances—on a main road amidst dazzling head lamps, and whenever the machine is put on its stand after dark. The gas tail lamp is fairly reliable when armed with a separate small generator of its own; but one generator is enough bother for anybody at cleaning time. When a long tube from the head lamp generator is employed, the gas pressure at the tail lamp is not always adequate.

### Dry Battery Tail Lamps.

I use a dry battery tail lamp in conjunction with a gas head lamp: Siemens, Ward and Goldstone, and A. H. Hunt all list good examples. Gas lighting is enjoyed at its best if dissolved acetylene cylinders are used. The tourist cannot yet rely on a universal supply of replacement cylinders; but it is easy to coax one's local supply man to stock them.

The second system may be termed "exhaustible electricity," and consists of electric lamps, fed from a dry battery, or from an accumulator which is not kept charged by a dynamo mounted on the motor cycle. The dry battery head lamp is quite excellent for a machine which is not very fast and is not used too much. Such outfits will give a moderate light for lengthy periods at a reasonable cost. They will not give a tremendous ray, as a high candle-power bulb would soon exhaust the cells; and the batteries are now far too costly for a regular rider to depend upon them. The accumulator system can give as good a light as any dynamo outfit, but is usually designed to furnish a weaker ray in the interests of the accumulator; heavy discharges—in the absence of a dynamo—spell rapid exhaustion, possible damage to the plates, and increased liability to being stranded with exhausted cells. The staffs of power stations are not always too careful over such small jobs as handling the recharging of a small 20 ampère-hour accumulator, and I, personally, should only rely on this system if I could recharge from the domestic supply in my own house. The boxes for carrying dry batteries and accumulators are now carried in the rear prongs of a double lamp bracket, acetylene generator fashion, and are both neat and convenient.

### Best but Most Expensive.

The third form of lighting is unquestionably the best, and consists of accumulators which are continuously charged up from some source of electric energy on the machine. The dynamo may be a separate unit, or may be combined with the magneto. These sets are quite expensive, but afford the maximum of cleanliness, convenience, and light. One or two equipments in which surplus current is tapped from the magneto are not suitable for a motor cyclist who does the bulk of his riding in the dark, as the discharge rate with lamps lit is heavier than the charge rate, so that the daylight riding must exceed the night work in the proportion of, say, 2 to 1. Moreover, the bulbs of such sets must be designed to avoid very heavy discharge rates, and therefore cannot afford a terrific light. Within these limitations such outfits as the B.T.H. Sparklight are thoroughly satisfactory; I have used one for over a year without a moment's trouble, and without renewing any bulbs. But for the fast full-size machine, which is worked hard, the genuine dynamo outfit is still a necessity. If spare bulbs are carried, it is as reliable as acetylene, gives a better light, is much less troublesome, and is altogether to be preferred.

ROAD RIDER.

# A T.T. Race for Private Owners

## Difficulty of the Amateur Definition. Some Cold Facts Reviewed.

THE proposal to organise a T.T. race in which entries shall be limited to private owners has naturally roused considerable interest, and is calculated to make every sporting amateur sit up and take notice. Loth as one is to pour cold water on any sporting proposition, and most of all on a suggestion which aims at divorcing sport from all commercial associations, the idea emanates from people with little or no experience of the administration of sport. The first problem is to find your private owner, to arrive at a theoretical definition of what constitutes a private owner, and then to apply that definition in practice so as to keep the trophy out of the hands of cleverly camouflaged trade riders.

The man in the street, unaccustomed to the lions in the path, says, roundly, "Insist that every entrant shall earn his living at some job which has not even the most distant connection with the motor trade." It sounds simple; but immediately the undergraduates are up in arms. They don't earn their own living at any job, they include many of the purest amateurs on the road, and you must unquestionably welcome their entries. The same applies to young fellows subsisting on allowances from their parents, or on incomes which they have inherited. After you have considered a few cases of this kind, you begin to realise that the definition of an amateur must not insist on his earning his living in any shape or form. Presently you hear of an intended entry from some enthusiast whose means of subsistence are extremely vague. He satisfies your committee that he normally exists on a couple of hundred a year, derived from backing horses, success at cards, and an annuity of, say, £50 from a deceased maiden aunt. You have to take his entry; but there is quite a chance that the whole of his racing expenses are being footed by a manufacturer, and that there will be a cool £100 in cash in his pocket if he wins. Finally, apart from the clear cases which widen your definition net till its mesh will admit almost anybody, and apart from the dubious cases which defy verification owing to the dishonesty of parties to the job, there are the borderline cases.

For example, we will suppose that an entry is received from a young man who is studying wireless telegraphy in the works of a big concern which not only constructs wireless apparatus but also manufactures magnetos and automobile lamps and dynamos. Is he "trade" or is he not? He may be as pure an amateur as any University Blue, or he may be subsidised to exploit his firm's magnetos, though he is not employed in their magneto department. Another youngster may be the son of the principal shareholder in a company which owns extensive rubber plantations. The boy may be a genuine private owner as a motor cyclist, but very possibly his father's rubber plantations sell the bulk of their output to one of the tyre companies. If so—and the facts will be hard to come by—it is probable that he will get considerable assistance in his efforts to win the Amateur T.T.

I think everybody with real experience in organising competitions will admit that it is quite impossible to sieve the entries so that the exclusion of riders enjoying special advantages can be even moderately guaranteed. If that is so, the whole principle of the race falls to the ground.

### Assistance from the Manufacturers.

In the second place, the factories manufacturing motor cycles cannot be left out of the reckoning. Business is business. These firms no doubt possess strong sporting interests, but they are money-makers before they are sportsmen. Victory in such an event may be worth thousands of pounds to some of them. They are not going to let victory go to a rival without putting forward a finger to grasp it. Few of them

**A T.T. Race for Private Owners.—**

would go the length of constructing special machines or special engines. But there would be no need to construct special engines. Some of the factories already possess special engines. These would freely be loaned to any "amateur" who wanted to borrow them. In other cases standard engines would be faked by the works staff. The private owner, entering a stock engine bought in the ordinary way and tuned by himself or with the aid of his local agent, would not stand a dog's chance in the race. He would be just as certainly beaten before ever he started as if he adopted the same procedure in the open T.T.

However, if we pretend for the moment that an exceedingly alert and shrewd management succeeded in squeezing out the shamateur and the camouflaged trade man, and contrived to guarantee that every engine in the race was a stock engine tuned only by amateur labour and skill, the event still remains unattractive, because—other things being equal—victory would fall to the longest purse.

Comparatively few amateurs can rely on adequate leisure. Preparations will consist of at least ten days in the Isle of Man, preceded by two or three months' hard training and hard tuning. Experimental work on Brooklands would be invaluable, and entails a considerable outlay; there is no road in the country where even at sunrise one can test an engine for *sustained* racing speeds; to compete in a 150 miles race with a machine which has never done more than two miles' hard work at a time is ridiculous. A certain amount of early morning speedwork on the road is possible, but there is nothing like a day or two at Brooklands to *prove* that an engine will stand an hour or two all out without injury. This test would not cost the metropolitan rider much money; but it implies a pretty bill for men living in the North or West, and particularly so if the engine is unsatisfactory on its first visit to the track, and requires a second and even a third test of an hour at full r.p.m.

**Practising Expenses.**

Expense is further connected with the preliminary practice in the Island. If the time at a rider's disposal is short, he really needs a couple of machines, as he cannot afford to miss several practices because he breaks something vital one morning. So if he goes to the Island a week before the race, he needs two machines; if he goes three weeks before the race, his hotel bills and incidental expenses will be correspondingly high.

The only distantly practicable suggestion which I have heard is that the promoters (presumably the A.C.U.) should buy the machines from agents' stocks, and deliver them to entrants in the Island after sealing all parts; and that all repairs, tuning, and adjustment should be done under supervision. For example, if I entered a Norton, Mr. Loughborough would buy it for me, say, in Bristol; and neither the Norton Co. nor myself would see the machine until I took it over under official supervision at Douglas. This system, analogous to the "stock machine" one-day trial, would probably succeed in eliminating "special" engines, and narrow the race down to machines "the same as you can buy" It would not, however, meet the main wish of many enthusiastic amateurs, which is that their *tuning* powers, no less than their *riding* ability, should be tested. For if the preparation period were lengthy, the knowing ones would manage to introduce one or two special engine parts; and if the preparation period were short, the entrants would have insufficient time both for tuning and for practice. Moreover, it might easily prove impossible for the A.C.U. to find all the necessary machines in stock. If trade revives, it is an open question whether scouring the agencies, say, in June, would produce as many T.T. Nortons or o.h.v. Triumphs or Scott-Squirrels as the entry might specify. It would naturally be impossible to enter a machine of any "small" make, or for any amateur to race on a machine of his own design and construction, fitted with a proprietary engine.

Altogether, attractive as the suggestion undoubtedly is from a sporting standpoint, it seems to me hopelessly impossible so long as human nature remains what it is.

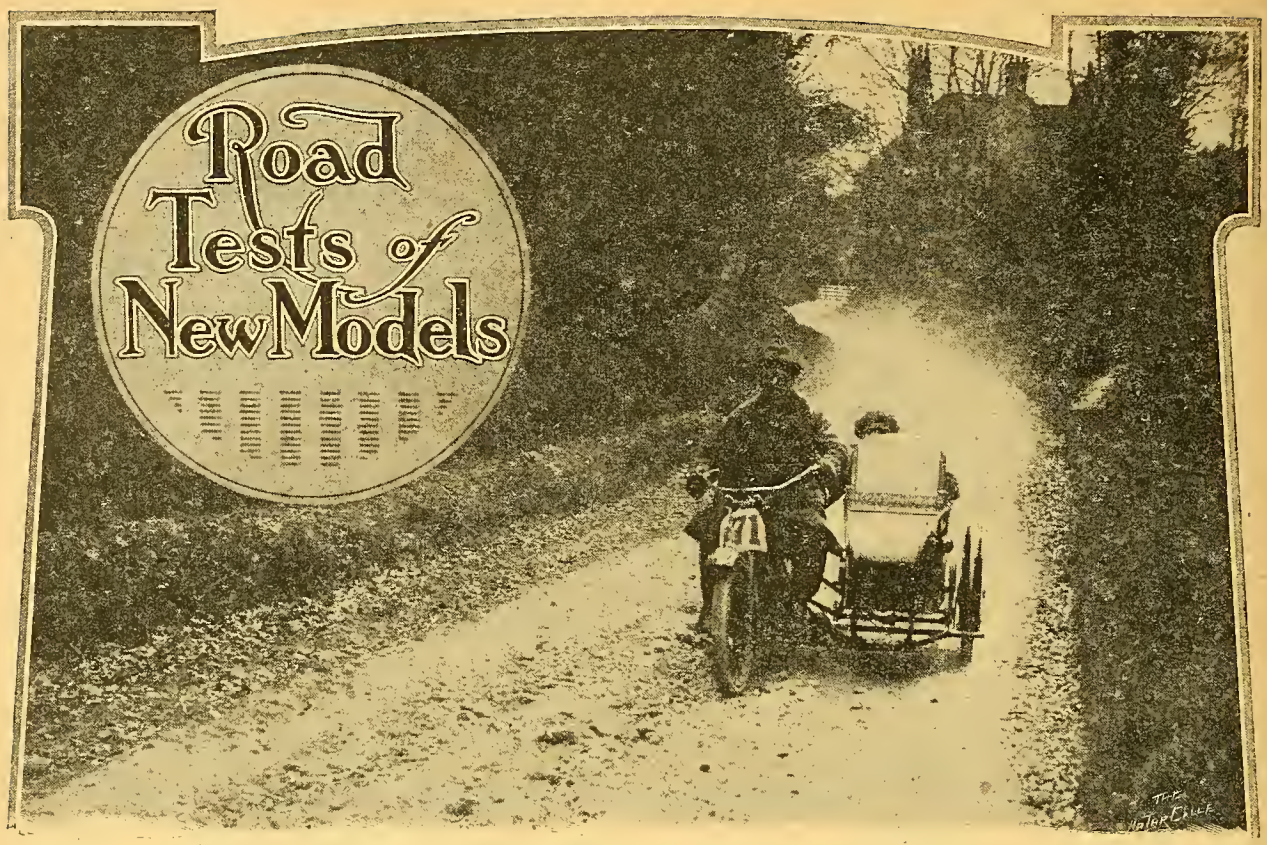
B. H. DAVIES.

# MOTOR CYCLES IN SCANDINAVIA.

DESPITE the very large number of British motor cycles which go overseas, almost every mail brings us news that our manufacturers are not adequately represented in many countries. Below we give a letter received this week from a reader who has just returned from a two years' sojourn in Scandinavia:

"'Seeing that this country is dependent on export,'' he writes, "I was surprised to find hardly any English motor bicycles in either Sweden or Norway. Though the place was full of American machines, mostly Reading-Standards, Harley-Davidsons, Indians, and a few Clevelands, I only saw about five English machines during my two years' stay. There are excellent opportunities for motor cycles, as competitions are popular, while during the winter months races on the ice, which gives excellent wheel grip for straight riding, are of frequent occurrence.

"The fault lies with our advertising and agents. During the whole of my stay in Sweden I saw no printed advertisements and only two display machines, and in both cases the model displayed was of a type not adapted to the country. The type of machine wanted is a cheap, reliable, high-powered one with large wheels and a very strong frame. Refinements such as legshields, windscreens, and electric light are seldom wanted. Now the agent of the Ariel Company in Gotenburg was displaying their 4 h.p. single-cylinder model, whereas their 8 h.p. model with its 28 × 3in. tyres and good springing would have suited the country well. Any British manufacturer producing a good 8 or 10 h.p. machine should be able to find a good market, though in many cases larger wheels and better ground clearance together with further simplifying and cheapening would be essential to success."



THE 6 h.p. MARTINSYDE SIDECAR OUTFIT.

*SPECIFICATION.*

*ENGINE: Martinsyde V twin, 70×80 mm. (680 c.c.), exhaust valves over inlets.*
*LUBRICATION: Semi-automatic drip feed.*
*TRANSMISSION: Enclosed chains, $\frac{5}{8}$in.×$\frac{3}{8}$in.*
*TYRES: 650×65 mm.*
*SIDECAR: Martinsyde.*
*CARBURETTER: Amac single lever.*
*IGNITION: Lucas Magdyno.*
*GEAR BOX: A.J.S. type; three speeds.*
*WEIGHT: 289lbs.*
*PRICE: £160 (less lighting outfit).*
*MAKERS: Martinsyde Ltd., Maybury Hill, Woking.*

THE more apparent virtues of a machine which reveal themselves when the latter is submitted to a brief road trial provide the critic with an appreciable knowledge of its behaviour. A trial spread over a period of months, however, enables the rider to become acquainted with both the good and bad points, which are found only by constant use and by necessary adjustments and repairs in the garage.

Equipped with a V twin engine having an unusual valve layout, the 6 h.p. Martinsyde, when first taken over for trial, was tested with special regard to the excellence of this feature of its design. As is now well known, this engine has overhead exhaust valves and inlets at the side, below them, thus the inlets are cooled by the incoming gases from the carburetter, while the exhausts are exposed to greater cooling draughts and are to some extent separated from the main portion of the cylinder casting. This must undoubtedly tend towards efficient and cool running and freedom from distortion. The engine is not unduly noisy, although a reduction of the valve clatter is possible. When correct adjustment of the carburetter is obtained, the engine "ticks over" in a most pleasing manner and answers faithfully to every touch of the throttle control.

Until we gained experience it was found that the operation of the gear control was somewhat difficult, and improved design of this detail might well be considered by the manufacturers.

Good judgment, however, has been exercised in dispensing with the all-enclosed chain case, and although the machine has been run through many trials during the past season, no chain trouble has been experienced; withal the chains are accessible.

Regarding the other mechanical details, the engine was at first equipped with pistons of an early type, provided with a minimum of frictional surface on the skirt. With these, piston slap became very evident, and finally new pistons were fitted; these—the present standard pattern—are good, being provided with a flush bearing surface which has been reduced slightly to facilitate running in.

So much for the unit. It would be impossible to outline the duties that the machine has had to complete during its trial. On the road the machine has never

**Road Tests of New Models.—**

suffered a serious failure. Once, during an abnormally heavy rainstorm, a "short" occurred between one of the high-tension terminals of the Magdyno and the aluminium cover provided for this instrument, and that is the worst trouble the writer can record against the machine.

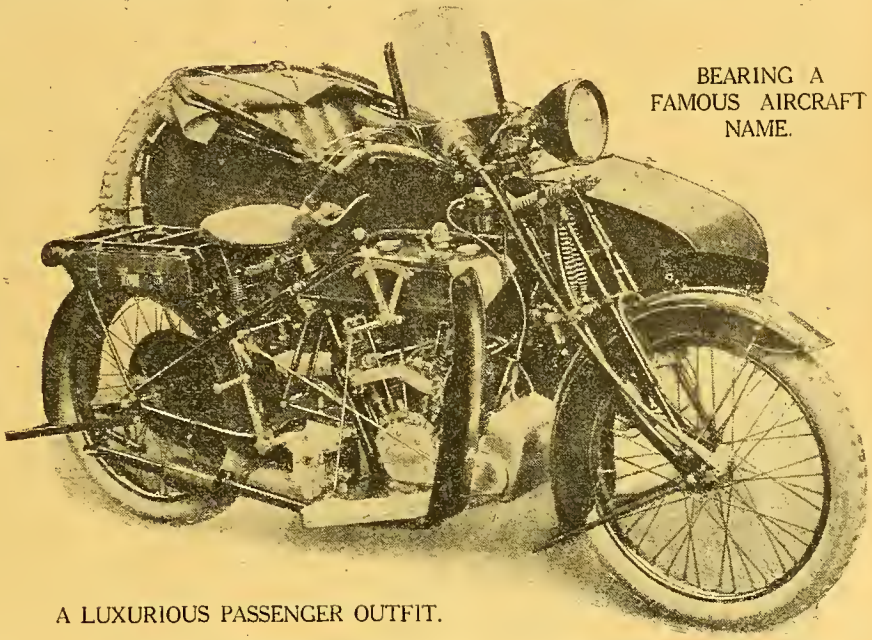
As for performance, the Martinsyde has demonstrated its climbing abilities by climbing the Brooklands test hill with four people on board, while on the level it will do normal touring speeds of 40 m.p.h. with ease and will touch 45 m.p.h. when required.

Correct handling of the three speeds is undoubtedly an important factor when the highest efficiency is required from the engine. The latter is more grateful when kept turning over at high speed, consequently changing down should never be unduly delayed. Detachable wheels would have been a pleasant luxury, but since punctures have been few, this has not been of great account.

### Criticisms—Pro and Con.

Steering is good, whilst the riding position is all that could be desired. A slightly larger capacity petrol tank (this has been fitted to the later models) would have been exceedingly useful, but it is possible to carry a two-gallon tin of petrol and a quart tin of oil in addition to luggage in the spacious locker behind the seat in the sidecar. This latter provides the comfort essential for a long tour, and equipped with a Martinsyde hood and screen, provides ample protection from the elements. The Magdyno lighting outfit has, with one exception, when water forced an entry into the switchbox, proved very successful.

Undoubtedly the Martinsyde is a thoroughly practical sidecar outfit designed to take two people anywhere at quite a good pace in comfort and with reasonable economy; moreover, in view of its quality, it appears that the manufacturers have made an honest attempt to provide real value for money.



BEARING A FAMOUS AIRCRAFT NAME.

A LUXURIOUS PASSENGER OUTFIT.

Two models of the 6 h.p. Martinsyde sidecar outfit are available—the *de luxe*, with interchangeable wheels and electric lighting, and the "standard," which, with these luxuries eliminated, sells at a competitive price.

## RECORDING THE AVERAGE SPEED.

ACCORDING to the majority of those who possess a speedometer, this accessory almost doubles the pleasures of motor cycling. Yet, on the average not one machine in six is so fitted. Without doubt the reason for this state of affairs is the expense of the instrument and the fact that much of its value is lost unless it is fitted to the new mount immediately on delivery.

We are afraid, therefore, that the future of an even more costly and complicated fitment—the average speed indicator, as outlined in an article in *The Motor Cycle* of the 12th ult. and supported by correspondents—would be by no means assured. It is pointed out as an advantage that the suggested indicator would embody a clock. Handlebar watches, however, are neither excessively unreliable nor expensive; and wristwatches are common and convenient. But the biggest objection to the instrument lies in something it does not do; it fails to record sheer maximum speed, unless, as far as present designs have gone, by the addition of practically another speedometer proper.

While, no doubt, average speed records are more faithful and true representations of a journey than the memory of a needle momentarily crossing the mile-a-minute mark, it is to be feared that, human nature being what it is, the latter would be preferred by the majority of motor cyclists. The average speed indicator would be too truthful to be popular.

## AN ENLARGED OLYMPIA.

OLYMPIA is to be enlarged. A new hall on similar lines to the existing building is to be erected on the property adjacent to the present hall, and will have an entrance in the Hammersmith Road. This project has resulted on representations by the Society of Motor Manufacturers and Traders.

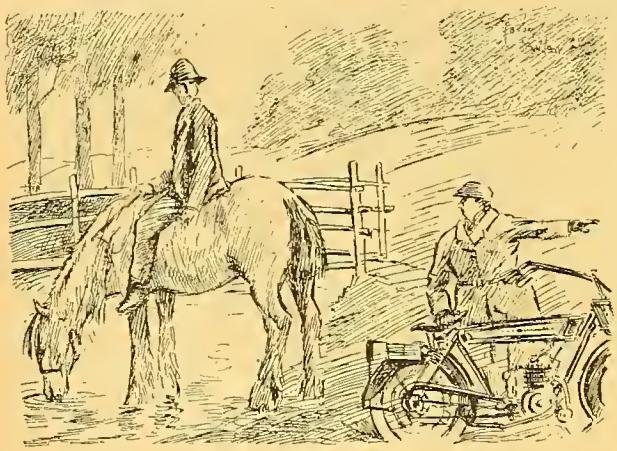
The floor space of the present and new halls will give a total area of over 300,000 square feet, which will make Olympia by far the most complete and up-to-date exhibition building in the United Kingdom. It is hoped to complete the new building by next autumn.

# A Motor Cyclist's Country Diary

Far from the Madding Crowd.

The Motor Cyclist's Heritage.

EVEN certain agriculturalists are advocating uprooting all the hedgerows in England and thereby adding many hundreds of acres of land to that available for producing food. Perhaps the hedgerows and the spreading trees rob the farmer of a certain amount of both grain and grazing, and no doubt neglected hedges, which are allowed to grow too high, are a source of danger and difficulty to



The farm lad who tells you of a "short cut."

both motorists and motor cyclists. But picture rural England without them! After all, the beauty and poetry and tradition of the country *do* count for something even in these days of materialism. We do not want to sacrifice everything to "hustle" and haste.

To return to a system of tethered cattle, to uproot all the wayside avenues, to banish the hawthorn and honeysuckle, would be to tear the very heart out of Eden and reduce it to a land of uninspiring railings.

Of course, no one in his right senses denies that there are certain stretches on many roads, and thousands of corners, which would be much better fenced with railings. As they stand, they are now a danger to all who journey that way, but to condemn them is not to include all the picturesque hedgerows in the country which are an integral part of its joy.

### A Bad Corner.

Writing of bad corners reminds me that only the other day a most careful motor cyclist, despite the continuous tune he had played upon his horn, narrowly missed being mixed up with a roadman, a wheelbarrow, a dog, and a heap of stones, which were located on the far side of a sharp turn hidden by towering hedges. The roadman admitted he was deaf, and then delivered himself of a bit of sound wisdom which might well be printed in red ink and forwarded to every road authority in England. He spoke thuswise:

"Now, you know, you or I might easily have been killed. . . . And if one of us had been then they'd have done summat at this 'ere corner. I allus notice that it takes about two smashes up to get these dangerous places putten right." . . .

### A Lunatic's Will.

I wonder if any reader of *The Motor Cycle* has by any chance seen extracts from a wonderful will left by a lunatic in Sunning Asylum? There is a wealth of poetry in it, and those of us who love the sounds and scenes of the country, who find an ever open and fascinating book in Nature, cannot help but feel that, insane though Charles Lounsbury may have been on some points, he yet had a soul. Note especially the following few sentences of what in his fancy he bequeathed to us.

"The meadows, with the clover blossoms and butterflies thereof, the woods and their appurtenances, squirrels, birds, echoes and strange noises, all the distant places which may be visited, together with the adventures there found. . . . The bloom of the hawthorn, the sweet strains of music, and the white clouds that float high over giant trees, and long days to be merry in, and the night and the moon and the train of the Milky Way to wonder at."

It is sometimes a wholesome thing that we whose heritage these sweets of life are, and who have the means of close association with them, should ask if we make the best use of our opportunities.

### Ruralists' "Directions," and Gypsies.

"You look troubled in your mind, my dears; let the gypsies tell you what's in store for you." Those were the exact words addressed to two motor cyclists the other day who had endeavoured to cut off three

"There was the fire with the stew-pot bubbling above it."

**A Motor Cyclist's Country Diary.—**

miles of good road which that day was infested with flocks of sheep and apparently all the cattle in England on their way to a local fair.

I know of few things more uncertain of their geography than sheep—except it be farm lads who tell us of short cuts. In France we used to ask military police and others the way to places, and always received the same answer, "We've only come here to-day." Well, that was better than the confidence the average "local" gives to motor cyclists as to ways and distances.

Well! we had been harried in mind and nerves and our souls endangered by violent curses upon all sheep and cattle breeders and their flocks and herds, when we came to a by-road. There was a youth ploughing in the field at the corner of it where it turned off the main highway, and, as luck would have it, he was turning his horses at the hedge as we came up.

### A Short Cut.

"There was nowt to stop us," he assured us; in fact, it was a short cut to where we wanted to be, and he would never think of going any other way. Possibly not—on foot; but he had not taken into account the squeezing of motor cycles over the narrowest of foot-bridges, the opening of eleven field gates, through which young horses were anxious to dash to the imminent danger of our machines, nor had he taken into account a bridgeless stream and ruts in places a foot deep. These were unconsidered trifles to him—or perhaps he was a humorist. Be that as it may, he went on whistling "To mow and sow and reap and hoe and be a farmer's boy," all unconscious of our inclusion of him in our general anathema of everybody and everything. . . .

Then, in a grassy country lane, which one might have imagined had got lost or was forgotten in these days of hustle, we came across a gypsy encampment. There was the fire with the stew-pot bubbling above it, there were the horses grazing in the hedge-backs, the black-haired, tawny children in clothes several sizes too big were in the picture playing with a greyhound, and the gypsiest of gypsy women smoking around the burning wood.

### A Gypsy Dish?

If we had been in a better humour we should have been struck by the picturesqueness of the scene which suddenly confronted us, and we might even have asked to taste the hedgehogs I am sure they were cooking. We might have inwardly thanked the farm boy for his advice. But, probably foolishly, we were out of tune with the world at large.

We had taken things too seriously instead of preparing ourselves for adventures—which, by the way, come much more frequently to the motor cyclist in the peaceful miscalled "uneventful country" than amid the crowd and hustle of town and city. So, I am afraid, we were rather offhand and even rather rude to the raven-haired lady who rightly judged we were worried and who'd have told us a wonderful story and promised us no end of good things for sixpence. . . . I have always loved the gypsies, too! and so I regret all the more that we passed on without a chat with them, for they can tell you more of England and Scotland than the most travelled of us know. J. FAIRFAX-BLAKEBOROUGH.

# STEERING BALANCE.

## A Plea for Closer Consideration of Over-all Efficiency at a time when Engines are Receiving so much Attention.

IN the drawing offices of most factories there appears to be a tendency to allow the question of engine performance to overshadow over-all efficiency. One point which, in the writer's opinion, has been badly neglected is steering balance. The difference in steering qualities of different machines has only to be tried to be appreciated, the average being a long way from the ideal.

I have ridden almost every standard make of machine, but have only found one or two which can be said to be self-balancing, a quality which every machine should possess. This leads one to conclude that proper weight distribution and the correct arrangement of the steering head have not yet received the attention due to them. I have had two Scotts, and found that both of them could always be ridden and steered "hands off" without the slightest difficulty. It may be argued that the low centre of gravity is the reason for this, but I do not think so.

Another machine I found which could be steered "hands off" riding solo was the 7-9 h.p. Harley-Davidson, which cannot be said to be low built by any means. For my own satisfaction, I once rode this machine from the outskirts of Garstang to the outskirts of Preston on the main road north (a distance of about ten miles) without touching the bars.

To appreciate that steering balance is one of the main factors in tireless riding, one should try to steer the average machine with hands off the bars. It can be done by gripping the tank and pressing on the footrests alternately, but the effort required will be a surprise to any rider who tries this method. When it is considered that opposing forces have to be corrected by constantly changing the position of the front wheel by means of the bars, the advantage of a self-balancing machine will be appreciated.

It is high time the makers gave the question of steering balance their closer attention. A machine should be ridden by body balance alone, and not by pushing first one and then the other of the handlebars.

Some designers seem to think that placing the engine so low that it will catch every three-inch projection, and by arranging the saddle position so that the unfortunate rider has to fold himself concertina fashion promote easy steering; but they are wrong. At present I ride one of the super-speed mounts which is of the above specification, but it is as bad, if not worse, than the majority. Why should this be so? A. E. S.

# OVERHAULING AN OLD MACHINE.

## How Skilled Attention may restore a Much Used Motor Cycle to New Condition.

SINCE the advent of the magneto and the countershaft gear box motor cycle design has undergone no radical change. There are many old machines, therefore, which, if they embody these two components, may be modernised to compare very favourably with the 1922 product.

These renovations usually imply the exercise of a certain amount of engineering knowledge—more or less in inverse proportion to the price paid for the machine. In the case under review, the machine was a spring frame 1915 7-9 h.p. Indian, and when purchased it appeared to be in poor condition in its detail parts, but the principal items, such as the engine, gear box, etc., were sound.

Fig. 1.—Hollow hinge pin for the spring frame, fitted with a large J.M. greaser.

### Attention to the Springing System.

The first item to demand attention was the spring frame. Due to inadequate lubrication, the moving parts were badly worn, probably due to the small oilers provided. A new hinge pin for the frame was made as shown in the first illustration. Similar pins were made for the small joints at the rear end of the chain stays and also for the connections between the eyes of the springs and the vertical members of the spring frame.

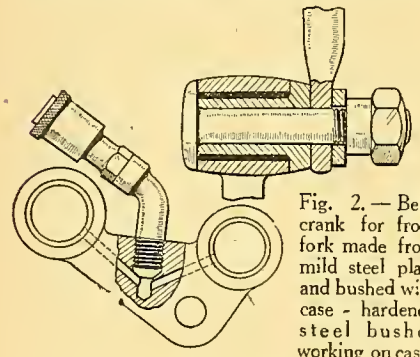


Fig. 2.—Bell-crank for front fork made from mild steel plate and bushed with case-hardened steel bushes working on case-hardened pins.

Fig. 3.—Method of fixing clevis pins in the front fork links.

The leaf springs were thoroughly scraped, and, before assembling, their working faces were treated to a mixture composed of equal parts of thick graphite grease and thick paint.

When the front fork was examined, it was found to need attention, the smaller holes in the bell-cranks being oval to the extent of $\frac{3}{32}$in. It was apparent that nothing short of new bell-cranks of huge proportions would provide any permanent satisfaction, so a completely new set of bell-cranks and pins was made. The former were cut from a piece of mild steel plate, and were as shown in fig. 2. They were bushed with case-hardened steel bushes, and worked on case-hardened pins.

The principal dimensions are as follows:

| | |
|---|---|
| Diameter of hole in large eye of bell-crank ... ... ... | $\frac{11}{16}$in. |
| Diameter of hole in small eye of bell-crank ... ... ... | $\frac{5}{8}$in. |
| Width of large eye of bell-crank | $1\frac{1}{8}$in. |
| Width of small eye of bell-crank | $\frac{13}{16}$in. |

The method of fitting the pins into the clevises (which were new and made larger) is shown in fig. 3, the nut being turned away from the hub. Both the pins were lubricated from one large greaser on the bell-crank.

On dismantling the engine completely, it was at once seen that it wanted new big ends. Both the crank pin and the connecting rod races were ruined through running with chipped rollers. These parts were ordered and fitted, great care being taken to make the flywheels true. New exhaust valve tappets were made and put in, the guides being reamed out to $\frac{5}{16}$in. to suit. The timing gears were perfect.

### Engine Modifications.

However, the pistons were in poor condition, also the cylinders, the clearance at the top of the cylinders being 18/1,000 in the rear and 15 in the front. As the machine was to be used with a sporting sidecar, the writer decided to effect any changes which might conduce to speed. As new aluminium pistons had to be made for the engine, raising the compression ratio from $3\frac{1}{2}$ to $4\frac{1}{2}$ to 1 did not involve much work.

The cylinders were chucked up in a lathe and three very light cuts taken off the bore of each. Each cylinder was then lapped on two lead laps. The outcome of this was a perfect bore both as regards accuracy and finish. Only two other changes of note were made on the engine. One was the fitting of a new throttle, the other the fitting of dustproof covers to the exhaust valve springs. These changes are worthy of description in detail.

Undoubtedly the most annoying feature of the old Indian engines was the throttle. This quickly developed wear, causing air leaks and difficult starting, while the slow running was completely spoilt. A new throttle was made to the design shown in fig. 5. The old throttle barrel was bored out to make it true, and a new throttle made out of a solid piece of gun-metal. This throttle had a trunnion formed on each end of it, and these trunnions turned in end plates fixed into the barrel. The end plates were held in position by long studs running on each side of the barrel. A slot for admitting extra air was cut in one end of the throttle, and a corresponding slot cut in the end plate. A small slide outside the end plate shuts this off when necessary. A small lever was fixed on the outside trunnion for moving the throttle. The friction on the air slide was caused by the small spring washer shown at (a) in sketch, pulling the lever (b) up against the air slide. Sufficient end play was left in the throttle to allow for this. When these alterations were finished, the machine's slow running was wonderful. It was possible to start from cold in summer without injecting.

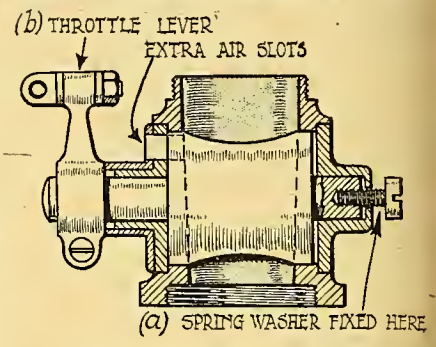

Fig. 5.—Alterations to the throttle.

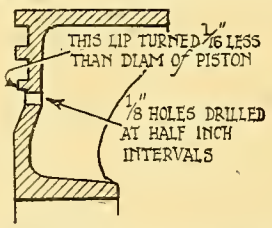

Fig. 4.—Section of wall of aluminium piston. The distance from the centre of gudgeon pin to the crown was increased by $\frac{3}{8}$in. in order to raise the compression.

The small push rods on the tops of the inlet domes were removed. These were made of silver steel, the ends being made red hot and quenched in oil. Covers were fitted over the exhaust valve springs. The construction of these is shown in fig. 6. A considerable amount of minor detail work was also carried out.

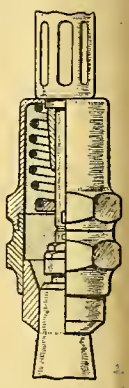

Fig. 6.—Construction of exhaust valve spring cover.

All the painted parts were treated to three coats of Indian enamel, and two coats of copal varnish, the finish obtained being well worth the trouble entailed by this procedure. When the outfit was finished it looked exceedingly handsome, and ran beautifully. The changes to the engine made a considerable difference to the speed, the machine with a sporting sidecar being capable of 60 m.p.h. without undue fuss.

It might be added that all the work was carried out on a 6in. lathe, and in the course of three winter months.—ENGINEER.

### *FAMOUS SCOTTISH HILLS.*

Sir,—Will you allow me a few comments on Mr. B. H. Davies's notes, which recall many pleasant and a few unpleasant memories? I have not a copy of the Scottish contour book at hand, but I think reference to it will show that the "Pass of the Cattle" is six, not five, miles each way. I wonder if he has ever ridden a machine of less than the 500 c.c. class up it? I am inclined to doubt it, or he would not give four miles as the top gear length. I should say three miles top gear, two and a quarter second and threequarters bottom, certainly so for small machines. Again, if I may venture to doubt so eminent an authority, I do not think the gradient of the Inverfarigaig corkscrew even approaches 1 in 5; as far as the *gradient* goes it is an easy second gear hill, and that probably accounts for the many failures. Riders do not take it slow enough; on a low bottom gear, with very little throttle, it is not, in my opinion, a difficult hill to climb clean.

Two hills which between them in the last two Scottish Six Days have accounted for more failures than any others are not mentioned—Mam Rattachan and Glendoe. If memory serves, there were no fewer than twenty-four failures on the first named in 1920, due chiefly, it is true, to a fiendish patch of very loose earth about halfway up; but, under any circumstances, it is a "man's size" hill—with an extremely deceptive gradient. Glendoe is possibly even more beloved by the Edinburgh M.C. than Amulree. I doubt if there is any hill in the British Isles on which a novice, even though mounted on a first-class machine, is more likely to fail. The down hill stretches before the top eventually convinces him that he has missed the "end of an observed hill" notice; then suddenly there is a snorter of an "S" bend on a pukka 1 in 4 gradient with a surface chiefly conspicuous for its absence. (Rev.) J. M. PHILPOTT.

### *ECONOMICAL MOTORING FOR TWO.*

Sir,—Is there any British firm having sufficient courage and enterprise to build a really cheap efficient two-seated three-wheeler? As a motorist of long experience, I can say that an unlimited market awaits a machine on these lines:

Pressed steel frame carrying two-cylinder vertical two-stroke air-cooled engine (say 70×80 mm.) set on centre line, giving flywheel ignition and lighting and driving by disc to cross-shaft, thence by cased chain to rear wheel.

Weight need hardly exceed 3 cwt. 2½in. tyres would suffice; perhaps 3in. on rear wheel.

Reliability, simplicity, and economy would be obtained with smooth, variable gear of wide range and a reverse. There is no reason other than greed why such a machine could not be profitably sold at £90. VIATOR.

London, S.W.16.

### *HEAVY SIDECAR FUEL CONSUMPTION.*

Sir,—Might I inquire through your columns what mileage per gallon any of your readers are getting with M.A.G.-engined two-seater Matchless 1921 or 1922 machines? My usual load, including myself, is twenty stone, and I was surprised to find that my m.p.g. works out at about 35, speed average about 20 m.p.h. G.E.

Sheerness.

### *IS "THE GAME" WORTH THE CANDLE?*

Sir,—I have read with interest the article entitled "The Great Game," in which the writer complains that more private owners do not go in for such events. The reason for this appears to me, however, to be pretty obvious. Motor cycles were designed to travel on roads, or apologies for such, and were not intended to clamber up boulder-strewn mountain tracks, or cross the rocky beds of rivers. While no doubt fun on somebody else's machine, to the average owner who takes a pride in his mount, and who is probably none too well blessed with this world's goods, the game is not worth the candle. Smashed guards, damaged crank cases, and bent footrests may not constitute a wrecked machine, but they cost quite a lot to repair, and insurance companies will, quite rightly, not pay for this class of damage.

As to sport, I cannot see where it comes in. To my mind, using a good machine for this purpose is like galloping across a boulder-strewn seashore with a hunter. One might finish the ride with nothing worse than a few bruises (and who minds that?) but it could hardly be called sport for the poor horse. A. ARNOLD.

### *CONDENSED CRITICISMS.*

Sir,—As the owner of an American big twin, I am comparing it with the British machine of your correspondent "3485." The machine, a 1920 Harley sidecar outfit, has covered 5,620 miles, which includes a tour in North Wales, and is ridden all weathers:

Tyres.—New rear tyre, other two still good, no punctures at all.

Cycle Parts.—Very strong, no trouble.

Mudguarding.—Bad.

Springing.—Excellent 3in. tyres and spring saddle pin.

Silence.—Excellent.

Speed.—50 m.p.h. with two up.

Oil Consumption.—Small (automatic hand pump only used on rare occasions).

Oil Pump.—Automatic, no trouble.

Petrol Consumption.—50 m.p.g. on the average.

Engine.—Quite a wonderful engine, no trouble whatever, and, except for decarbonising every 2,000 miles, has cost me nothing in repairs.

Gear.—Foolproof change, no trouble at all.

Clutch.—Foot and hand; it has never had any adjustment, and I can drive through London easily on top gear to-day.

Chains.—Front chain runs in oil spray, quite good; one new rear chain, and that considerably worn.

General Accessibility.—Chains good; engine, carburetter, and magneto practically inaccessible unless engine unit taken out of frame.

Brakes.—Internal and external, both powerful.

Lighting Set.—Six volt accumulator, no trouble whatever, and is most satisfactory.

Stewart Mechanical Horn.—No trouble, placed on sidecar bar and works hand or foot.

Sidecar.—Comfortable, possible to get two persons in at a pinch.

Sidecar Box.—In bulbous back, room for luggage for two for a week's tour.

Petrol Tank.—Double tank with two separate feed pipes, nothing will make the filler caps splash over.

Kick-starter.—Excellent; will mostly start engine at fourth kick without injecting even in winter.

Plugs.—Had trouble with mica plugs due to fraying.

Carburetter.—Excellent for slow running, easy starting, speed, acceleration, and reliability.

Transmission Shock Absorbers.—Must use clutch instead.

General Reliability.—No involuntary stops, except for a smoked plug or two when in Wales due to use of hand oil pump. The only nut I have ever found loose during the whole distance travelled was one in the spring fork.

F. W. ALGAR.

Sir,—I own a machine fitted with a 350 c.c. Precision engine which has been in regular use since January, 1920. I do about 100 miles nearly every week-end, and holiday tours of considerably more.

Speed.—Never been timed and have no speedometer, but will pass certain other much-advertised two-strokes which enjoy a reputation for speed, both on the level and uphill, as many of their testers know. Both machines being 350 c.c.

Hill-climbing.—Very good. Will climb Beacon Hill, sclo, on 5¼ to 1 top in dry weather. The Wyche Cutting is easily climbed on bottom 9½ to 1, as is also Rising Sun, even in bad weather, driving being the main factor on Cotswold grease.

Petrol Consumption.—Never below eighty, sometimes ninety, and tuned only for economy, have done 110 m.p.g., two up, on undulating roads.

Oil.—Is extremely economical on oil, about 150 miles to the sump full, about one pint for ordinary riding. The makers' claim of 300 miles per sump is too optimistic.

General Criticism.—Usually an easy starter, but requires an injection on very cold mornings. Vibration is practically non-existent. My carburetter is an early Amac with the gauze removed and a hole in the induction, four-stroking does not occur, even at the lowest speed, with intelligent handling of the air lever. Plugs have been my biggest trouble, and no porcelain plug I have tried will stand up long. The only plugs I have found to give satisfaction are K.L.G.'s (aero type). I have not escaped entirely trouble free. The makers replaced a defective crankshaft which broke—close to the garage, luckily. I also split the detachable head, due, I think, to a flaw in the casting, but maybe to my own carelessness in tightening the bolts down. I decarbonise at short intervals and very often fit new rings.

T.F.M.

Sir,—The following criticism of my 1921 6-7 h.p. B.S.A. sidecar outfit may be of interest. It was purchased on the 12th of August, 1921.

Tyres.—First-class, sidecar and front wheel have never needed reinflation since taking delivery; one puncture in back wheel, picked up nail wheeling out of garage.

Cycle Parts.—Very strong; no trouble at all.

Mudguarding.—Good; back best.

Springing.—Splendid (spring seat pillar).

Silence.—Nothing to complain about.

Speed.—55 m.p.h. on threequarter throttle; never been run all out.

Petrol Consumption.—50 to 55 m.p.g. on No. 1 spirit, 55 to 60 m.p.g. on half No. 1 and half benzole.

Oil.—No record kept. I am very generous with this.

Oil Pump.—No trouble at all.

Engine.—Ample power; would pull me out of a coal pit if road wheels would grip.

Chains.—Have not seen them yet.

Gears.—Perfectly simple, simply perfect.

Brakes.—Excellent; back, internal expanding, will stop machine on any incline; front very good.

Sidecar.—Roomy and comfortable, very well sprung, only fault rather too high for lady to step into; bad steps fixed on chassis.

Starting.—Four or five kicks after injection when cold, one kick when warm.

In conclusion, I will say that I have such good faith in the B.S.A. that if I were twenty-five years younger (I am forty-nine next birthday) I would enter for the London to Edinburgh Run, and I think I should have a chance of a gold.

Preston. CK 5269.

Sir,—With reference to the interesting account of "3485's" experiences with an Enfield, the particulars of the 5-6 h.p. Raleigh outfit of which I took delivery in July may be of service. I do not claim to be an "expert driver"; perhaps the "average touring duffer" referred to in another article in the same issue would fill the bill. Mileage 2,205 (Midlands, North Devon, Yorkshire dales).

Tyres.—Good; one puncture (one nail).

Cycle Frame.—Duplex frame and fittings excellent, lateral whip absent, slight whip noticeable at times on single tube above tank.

Mudguarding.—Good; rear guards might be wider in really bad weather. Legshields very efficient and keep engine cool.

Springing.—Excellent; the comfort of a spring frame when rigid laterally must be experienced to be believed. On the occasion of my only puncture, I drove four or five miles on a back tyre which was flat without knowing it until a really bad pot-hole caused be to look at the wheel. (My previous mount was a rigid frame.)

Silence.—All that can be desired.

Speed.—Up to 42 m.p.h. with all spares, passenger, petrol spare, and heavy luggage. Long runs, speedometer 30-35 for two hours on end (except, of course, slows for villages). (Salisbury, Basingstoke, Bagshot Road).

Oil Consumption.—Not measured. The automatic lubrication system via crank case suction and emergency flooding are quite satisfactory and absolutely reliable.

Petrol.—General average 50-55 m.p.g.; average running speed usually scheduled for 22-25 m.p.h. Load includes passenger and an Airedale, weight about 50 lb., also week-end luggage.

Engine.—As near perfection as can be obtained. Flexibility and acceleration good, climbs well, and one is tempted to hang on to top too long on one figure hills. Accessibility of engine perfectly arranged.

Gear.—Sturmey-Archer, so needs no comment.

Chains.—Appear rather on light side, ½in. Front chain tends to stretch unevenly (Renold chain), but I may have got hold of a "dud," though a colleague of mine has had similar experience. Adjustment very simple and has further merit that each chain adjusts independently of other. Chain cases very efficient, and chains keep free from grit and water.

A spectacular method—but not one we would advise readers to adopt—of demonstrating the stability of a Scott motor cycle. E. H. Widdowson travelling at 30 m.p.h. on Nottingham Embankment.

Wheels.—Interchangeability a great advantage, but wheels must be screwed very tightly on to hubs to avoid trouble. Original locking device poor, but this has been remedied.

Brakes.—Very powerful; no cause for anxiety anywhere in North Devon.

Sidecar.—Passenger compares this unfavourably with the large Rudge sidecar of our former outfit. Springing fair, but springing and upholstery of cushions, etc., could be improved. Bluemel latest pattern screen found to be perfectly satisfactory. Luggage grid (extra) carried on sidecar body is efficient, but does not stow a 30in. portmanteau comfortably (perhaps this is not a reasonable requirement). Sidecar locker very capacious and takes an endless amount of spare luggage; locker under seat also very convenient.

Petrol Tank.—2¼ gallons, no need to split a tin; petrol strainer in tank is of use and not for ornament only.

Plugs.—Lodge weatherproof; have not be touched so far.

Carburetter.—Amac, fairly satisfactory, prefer Senspray as fitted on old 'bus.

Shock Absorber (Transmission.)—Very good, can run evenly and slowly on top gear, but could do with more oil than it gets.

General.—One involuntary stop in whole use so far—petrol tank was dry. Engine runs smoothly, and, punctures excepted (touch wood), one can set a schedule and be sure of keeping well up to time. I note that one correspondent comments on the absence of this outfit from competition events, and the same fact surprises me, especially as during the first three months I had the outfit I purposely drove it hard to see what would smash while I was under guarantee, but nothing did. A.Y. 9093.

Loughborough.

## *FUTURE T.T. RACES.*

Sir,—I have followed the correspondence *re* the T.T. dates with much interest, as I have seen many T.T. races and am a prospective amateur entrant. Although the suggestion has been made to hold the races in September, it does not seem to have been taken up by the A.C.U. I give some reasons below which I have not seen given before in favour of this suggestion.

(1.) The race would take place shortly before Olympia and would give a splendid opportunity to manufacturers to show us the capabilities of their new models.

(2.) The weather is usually ideal in September.

(3.) Many motor cyclists who are in business would not consider taking their holidays in May or early June. On the other hand, quite a number would be glad of an opportunity to spend a fortnight in the island in September. The 'varsities also would be down. Here are two fields from which a larger number of private-owner entrants might be gathered. The only apparent objection to holding the races in September seems to be the difficulty of the morning practising. R. G. SHAW.

Sir,—There have been so many suggestions for the future T.T. that I feel I must give my opinion. I think the most useful race to the trade would be a standard machine contest. It would be much more searching, and would give the manufacturers of the winning machines much more credit than the present race. Unlike an amateur race, it would have to be managed by the A.C.U., who could easily make arrangements concerning standardisation. I do not mean for this to take the place of the present T.T., but to be included just for a trial. SUGGESTION.

Bury.

## *THROUGH FEMININE GOGGLES.*

Sir,—As a lady rider of some nine year's standing may one be permitted to controvert some of the statements made in the article "Through Feminine Goggles" in your issue of January 26th?

Firstly, the statement that two-stroke machines are not considered to be very fast. The writer's standard Velocette—a lady's model—is capable of a maximum speed of 42 m.p.h. (by stop watch), and is capable of maintaining the Bonniksen at 36 m.p.h. continuously, without either "excessive vibration or piston slam." If one considers sporting models (and one notices four of the five ladies on the frontispiece are addicted to sporting handle-bars), the writer's sporting mount has actually averaged 27 m.p.h. over 175 miles of flat country—in the rain. More powerful sporting machines would do very little better than this.

After fairly extensive experience with both four-stroke and two-stroke machines, for sheer speed in comfort the two-stroke has it every time; but the cylinder must not be above 250 c.c. (this applies only to single-cylinder air-cooled machines).

The writer's open frame lady's model weighs 4lb. more than the gentleman's model, and the steering is even better. Altogether, the lady's machine is ideal for "stunting," and, for the average lady rider, is to be recommended in preference to the standard machine, if only on account of convenience and comfort. It is not always convenient to don special attire for short journeys, and the open frame obviates the necessity for this. Has the writer of the article ever ridden a Scott?

(Mrs.) MARY C. JENNISON.

## *MYSTERIOUS TEMPORARY SEIZURES.*

Sir,—I was rather surprised to read the letter in your issue for January 19th, 1922, under the above title. Surely, if your correspondent's engine is troubled in this way, the obvious thing to do would be to put his clutch "out" instead of raising the exhaust valve; then he would have no need to congratulate himself on coming to rest "fortunately still upright."

Incidentally, this would also prove whether the trouble is in the engine or elsewhere.

Would it not be possible that the trouble lies in his gear box, which automatically cures itself through the action of kick-starting? 5-6 BROUGH SOLO.

Cheshire.

Sir,—When I took my engine down for decarbonising, etc., I made the alarming discovery that the pin which carries the inlet valve rocking lever in the timing case was loose and free to move endways through the crank case wall into the flywheels. It also happens that there are three or more holes drilled in the flywheel rim, for balancing purposes, I suppose, and these holes revolve exactly opposite the end of the rocking lever pin.

The consequences of the pin moving endways can be left to the imagination, and I dread to think what might have happened had the machine been chain-driven and the engine suddenly locked while at speed.

Why the engine was not smashed up I cannot understand, as the locking actually happened twice on the road, once while testing at speed.

I would suggest that your correspondents who have been troubled with "temporary seizure" on four-stroke engines verify the security of their valve rocker pins, as there is a brightening on my flywheel where the pin had been rubbing.

Leeds. U 9896.

## *TOLLS AND HOW TO AVOID THEM.*

Sir,—I beg to thank your correspondent, Mr. Cuthbert Wilkinson for his information. It is not the paying so much as the imposition of being mulcted a return ticket when not needed. The one consolation with regard to the Bursledon Bridge is the "privilege" of taking a single ticket! Considering the recent information that two million odd pounds have accrued from the motor tax, I think it time some movement was set afoot to do away with these bridge tolls once and for all. P. FREEMAN.

Sir,—If Mr. Wilkinson or any other of your readers wishes to avoid the tolls at Bursledon and Itchen ferry between Chichester and Southampton, and, incidentally, find better roads, let him try the following:

On entering Fareham turn sharp right for Wickham instead of carrying straight on, thus avoiding the tram lines in Fareham and the nasty corner in Titchfield. From Wickham to Botley, bearing left at each of the two fork roads between these places, Botley to West End, and enter Southampton *via* Swaythling and Portswood.

At present the road between Swaythling and Portswood is "up." This can be avoided by keeping straight on instead of taking the sharp left-hand bend immediately after the railway bridge at Swaythling Station. This road will bring one into the Southampton-Winchester road, where turn left and enter Southampton *via* the Avenue and London Road.

Southampton. CR 4910.

### REAR LAMPS FOR ALL.

Sir,—At the annual general meeting of the Gloucester M.C. and L.C.C., held at the Spread Eagle Hotel, Gloucester, on the 31st ult., pleasure was expressed for all that you have done, and are still doing, in connection with the furthering of legislation dealing with the carrying of rear lights on cycles, and taxation. As a club, we feel strongly that these matters must not be lost sight of, and that the re-establishment of the law compelling all vehicles to carry rear lights should take place immediately in the general interest of all road users.

FOR THE GLOUCESTER CLUB,
Frank R. Ware, Hon. Secretary.

### "UTTERLY AMAZING SPEEDS."

Sir,—Referring to "Tomaso Dubitans's" letter under the above heading in your issue of January 26th, we, as importers, immediately recognise, by the performance, the Henderson.

It seems strange to us that your correspondent should criticise statements made concerning a motor cycle of which he has little or no knowledge (no retail deliveries at this time having been made in this country). The statements referred to can be vouched for by the American Police, who witnessed the trials of the new de luxe model, and who have placed numbers of orders in view of the extraordinary performance. Ignoring the question of the veracity of his remarks, he cannot even correctly or fairly quote an extract. He states, "a straightaway run from," which words do not appear in the catalogue referred to, and are, therefore, misleading.

Every model de luxe Henderson is guaranteed by the factory to do 75 m.p.h., and there is no reason why, on a good straight road across the desert for thirty-two miles to the mountains, an average speed of 65 m.p.h. should not be obtained. The grade varying from 2% to 14% (a maximum of 1 in 7.14) would not appreciably reduce the speed of a four-cylinder motor cycle travelling at over 70 m.p.h. The catalogue referred to does not imply in any way that the motor cycle was running up the maximum incline the whole time, nor for any great portion of the time.

Now as regards coolness of the cylinders, why should they not be touched with the bare hand? No suggestion is made or implied that bare hands were held indefinitely against the cylinders.

We cannot help but think that if "Tomaso Dubitans" delights in seeing his nom-de-plume in your excellent publication, that it would be an advantage for him to make correct quotations, and at the same time have some knowledge of the subject to which he refers.

MELCHIOR, ARMSTRONG AND DESSAU, LTD.
H. Harris.

### T.T. RACES FOR PRIVATE OWNERS.

Sir,—May I beg a little space of your valuable paper in answer to Mr. Pooley's letter? I have nothing to say regarding an amateur T.T. I am in favour of it. What I do object to are his club rules: "Membership is prohibited to those who are engaged or employed in the manufacture, sale, exhibition, or exploitation of motoring goods or accessories." Supposing other sports clubs, say football and cricket, refused men who were connected with the manufacture of goods used, what is going to happen to those concerned?

R. H. E. LOTEN.

Sir,—It would appear that, apart from the difficulty of defining an amateur, the grave problem is to find a suitable course owing to road races being prohibited in England. In your issue of January 26th, two different sands were mentioned as being good speedways; this may be so, but if an open T.T. race were held on any beach, I think that the essential road race flavour of the I.O.M. T.T. would be lacking; the same applies to Brooklands, also mentioned. Again, there are no sands placed centrally enough to be convenient to motor cyclists from all parts of the country. Altogether, "Sportsman's" description of some road races in Ulster should appeal to the sporting fraternity as the sort of thing that is wanted, but, unless a suitable park or estate is lent, or the Government approached successfully, many riders, myself included, will be disappointed.

Rugby. MUDGE.
